Executive Summary

This report presents the results of the traffic impact analysis conducted for the proposed Rocketship School at 1700 Cavallo Road in Antioch, California. The proposed project would replace the existing building with a new 24,357-square foot K-5 charter elementary school with an enrollment of 600 students and 32 full-time staff. Access to the project site would be provided via three on-site driveways, one with full-access and two with partial-access (entry-only and exit-only), as well as a one-way access easement through the adjacent County parcel.

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Antioch and the Contra Costa Transportation Authority (CCTA), which serves as the Congestion Management Agency (CMA) for Contra Costa County. A County Congestion Management Program (CMP) analysis was not required because none of the study intersections are part of the CMP network. However, many of the study area roadways are considered routes of regional significance. The suburban arterial routes within the study area were evaluated in accordance with the East County Action Plan (ECAP). The traffic study includes an analysis of AM and PM peak hour traffic conditions for nine signalized intersections and two unsignalized intersection in the vicinity of the project site.

Project Trip Generation

The trip generation rates for the proposed school are based on counts Hexagon Transportation Consultants, Inc. conducted at existing Rocketship Schools in San Jose between 2012 and 2014. The trip generation rates at Rocketship Schools in San Jose are significantly higher than the elementary school trip rates published in the Institute of Transportation Engineers' *Trip Generation Manual, 9th Edition*. The magnitude of traffic generated by the proposed school was estimated by multiplying the observed Rocketship School trip generation rates by the proposed enrollment (600 students). Given that the existing building on the site is currently vacant, no credits or reductions were assumed for the trips generated from the previous use.

Based on the surveyed trip generation rates and an enrollment of 600 students, the project would generate 1,650 daily trips, 578 trips (314 inbound and 264 outbound) during the AM peak hour, and 314 trips (128 inbound and 186 outbound) during the PM peak hour.

Project Impacts

The results of the intersection level of service analysis are shown in Table ES-1. The analysis determined that under all scenarios with and without the project, when measured against the City of

Antioch and ECAP level of service standards, all of the signalized study intersections are expected to operate at acceptable levels (high-level LOS D or better). In addition, under all scenarios with and without the project, the worst stop-controlled approaches at the unsignalized study intersections would operate at LOS C or better during one or both peak hours, which complies with the City's mid-level LOS D standard for intersections not on a Route of Regional Significance. Therefore, the project would not result in a significant impact on intersection levels of service.

Other Transportation Issues

According to the 2013 Contra Costa County CMP *Technical Procedures*, the proposed project would not have an adverse effect on the existing transit, pedestrian, or bicycle facilities in the study area.

Based on a review of the project site plan, Hexagon has provided the following recommendations to improve site access, and on-site circulation.

Recommendations

- The northern parking lot should be reserved for staff parking only, given that there is not sufficient space at the end of the aisle for vehicles to turn around if the lot is full.
- The four 90-degree tandem spaces within the northern parking lot should be converted to standard 90-degree spaces with two spaces accessed via the adjacent county parcel and two spaces accessed via the project driveway.
- During student unloading/loading periods, school staff or volunteers should direct traffic and place cones in the drive aisles while students unload/load. After all students have cleared the loading zone, staff should remove the cones and allow traffic to move again so that the next 10 vehicles can enter the loading zone. Staff members or parent volunteers should be stationed along the length of the student loading zone to assist students in and out of vehicles and ensure they safely walk to the school. Staff or volunteers should also ensure that parents do not leave their vehicles unattended in the loading zone while they visit the school and direct parents to unload/load students in a timely manner and then exit the loading zone. Parents that need additional time, for example to complete a phone call or to communicate with students before leaving the site should be directed to park in the designated on-site parking spaces to ensure the loading zone is available for its intended purpose.
- During the student unloading/loading periods, the entry-only driveway at the southern on-site parking lot should be monitored by staff or volunteers to prevent parents from using the parking area as a student unloading/loading zone and to avoid conflicts with vehicles exiting the designated student loading/unloading zone. Staff and/or traffic cones should be positioned adjacent to the exit gate at the end of the student loading/unloading zone to instruct vehicles to merge into one lane and direct traffic flow toward the exit-only driveway.
- At the Cavallo Road/East 18th Street intersection, the additional trips added by the proposed Rocketship School would increase the eastbound 95th percentile left-turn queue by 75 feet and 50 feet, or three vehicles and two vehicles, during the AM and PM peak hours, respectively. The increase in queue length would exceed the existing turn pocket storage, possibly causing some left-turn vehicles to queue in the adjacent through lane while waiting to enter the left-turn pocket. Because East 18th Street has two through lanes in each direction, through traffic could continue to proceed in the curb lane if the inner through lane is blocked by left-turn traffic. The queue spillover would have an insignificant effect on traffic operations at this intersection because the spillover would occur for only a few seconds during only some signal cycles during the peak hours before and after school, and the left-turn queue is expected to completely dissipate during

each signal cycle. Furthermore, the intersection would continue to operate at LOS C even if eastbound through traffic were reduced to the use of a single lane for the entire hour. Nevertheless, median striping modifications are recommended to encourage eastbound left-turn queues to extend into the center turn lane if necessary. The modification would remove the left-turn pocket taper striping to increase the queue storage available for use by eastbound left-turn traffic while still accommodating the existing left turns to and from adjacent driveways and Woodland Drive.

Therefore, this intersection was analyzed using the HCM 2000.**Bold** indicates a substandard level of service.**Bold** indicates a significant project impact.

1. Introduction

This report presents the results of the Transportation Impact Analysis (TIA) conducted for the proposed Rocketship School at 1700 Cavallo Road in Antioch, California. The project site is located on the west side of Cavallo Road just north of East 18th Street. The existing building on the project site contains approximately 24,900 square feet and is currently vacant. The proposed project would replace the existing building with a new 24,357-square foot K-5 charter elementary school with an enrollment of 600 students and 32 full-time staff. Access to the project site would be provided via three on-site driveways, one full-access and two partial-access (entry-only and exit-only), as well as a one-way access easement through the adjacent County parcel. The project site and the surrounding study area are shown on Figure 1. The proposed site plan is shown on Figure 2.

Scope of Study

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Antioch and the Contra Costa Transportation Authority (CCTA), which serves as the Congestion Management Agency (CMA) for Contra Costa County. A County Congestion Management Program (CMP) analysis is not required because none of the study intersections are part of the CMP network. However, many of the study area roadways are considered routes of regional significance. The suburban arterial routes within the study area were evaluated in accordance with the East County Action Plan (ECAP). The traffic study includes an analysis of AM and PM peak-hour traffic conditions for nine signalized intersections and two unsignalized intersections in the vicinity of the project site. The analysis focuses on the peak commute periods from 7-9 AM and from 4-6 PM given that classes are primarily held between 7:30 AM and 4:30 PM and because it is during these hours that traffic conditions on the surrounding roadways are generally the most congested. The study also includes an analysis of student drop-off/pick-up circulation, and transit, bicycle, and pedestrian access.

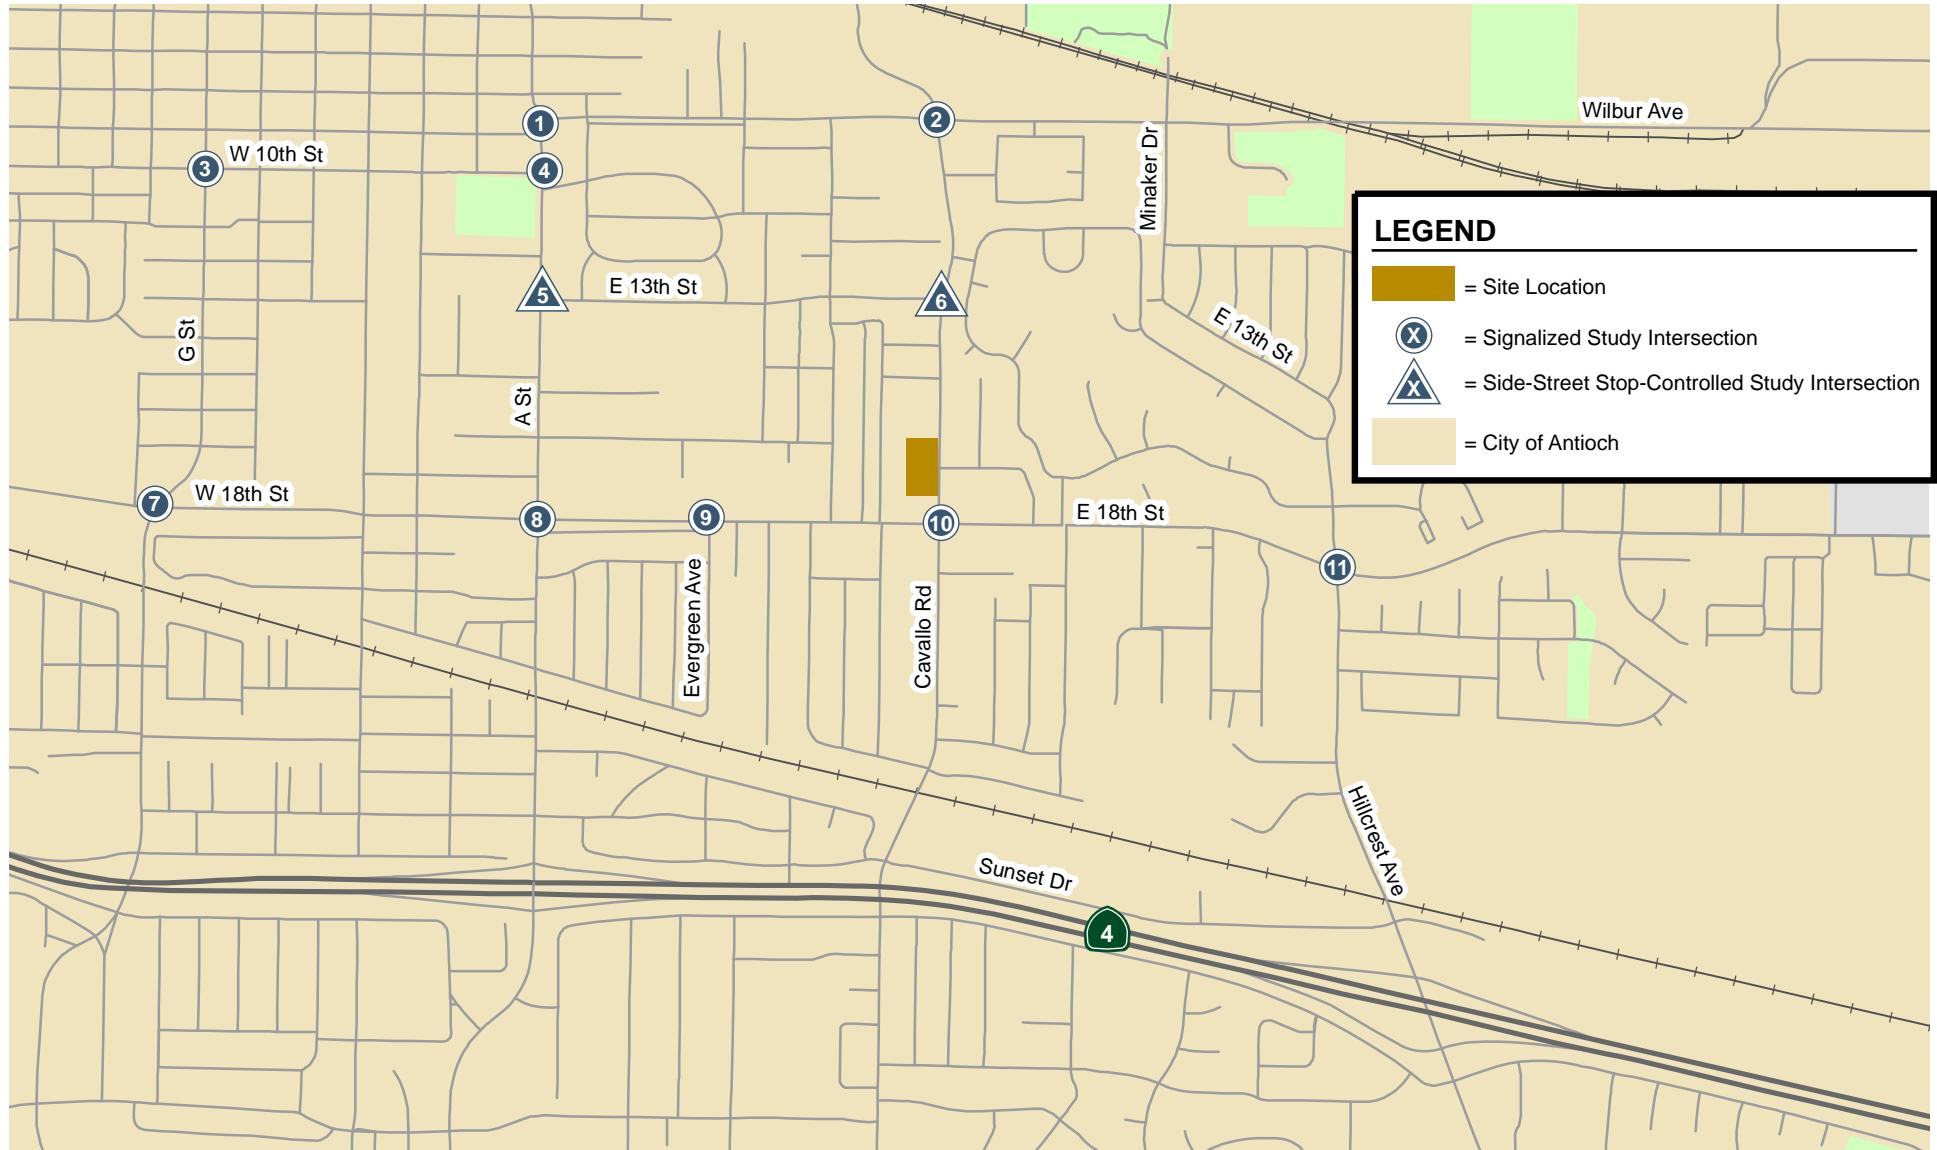

Figure 1
Site Location and Study Intersections

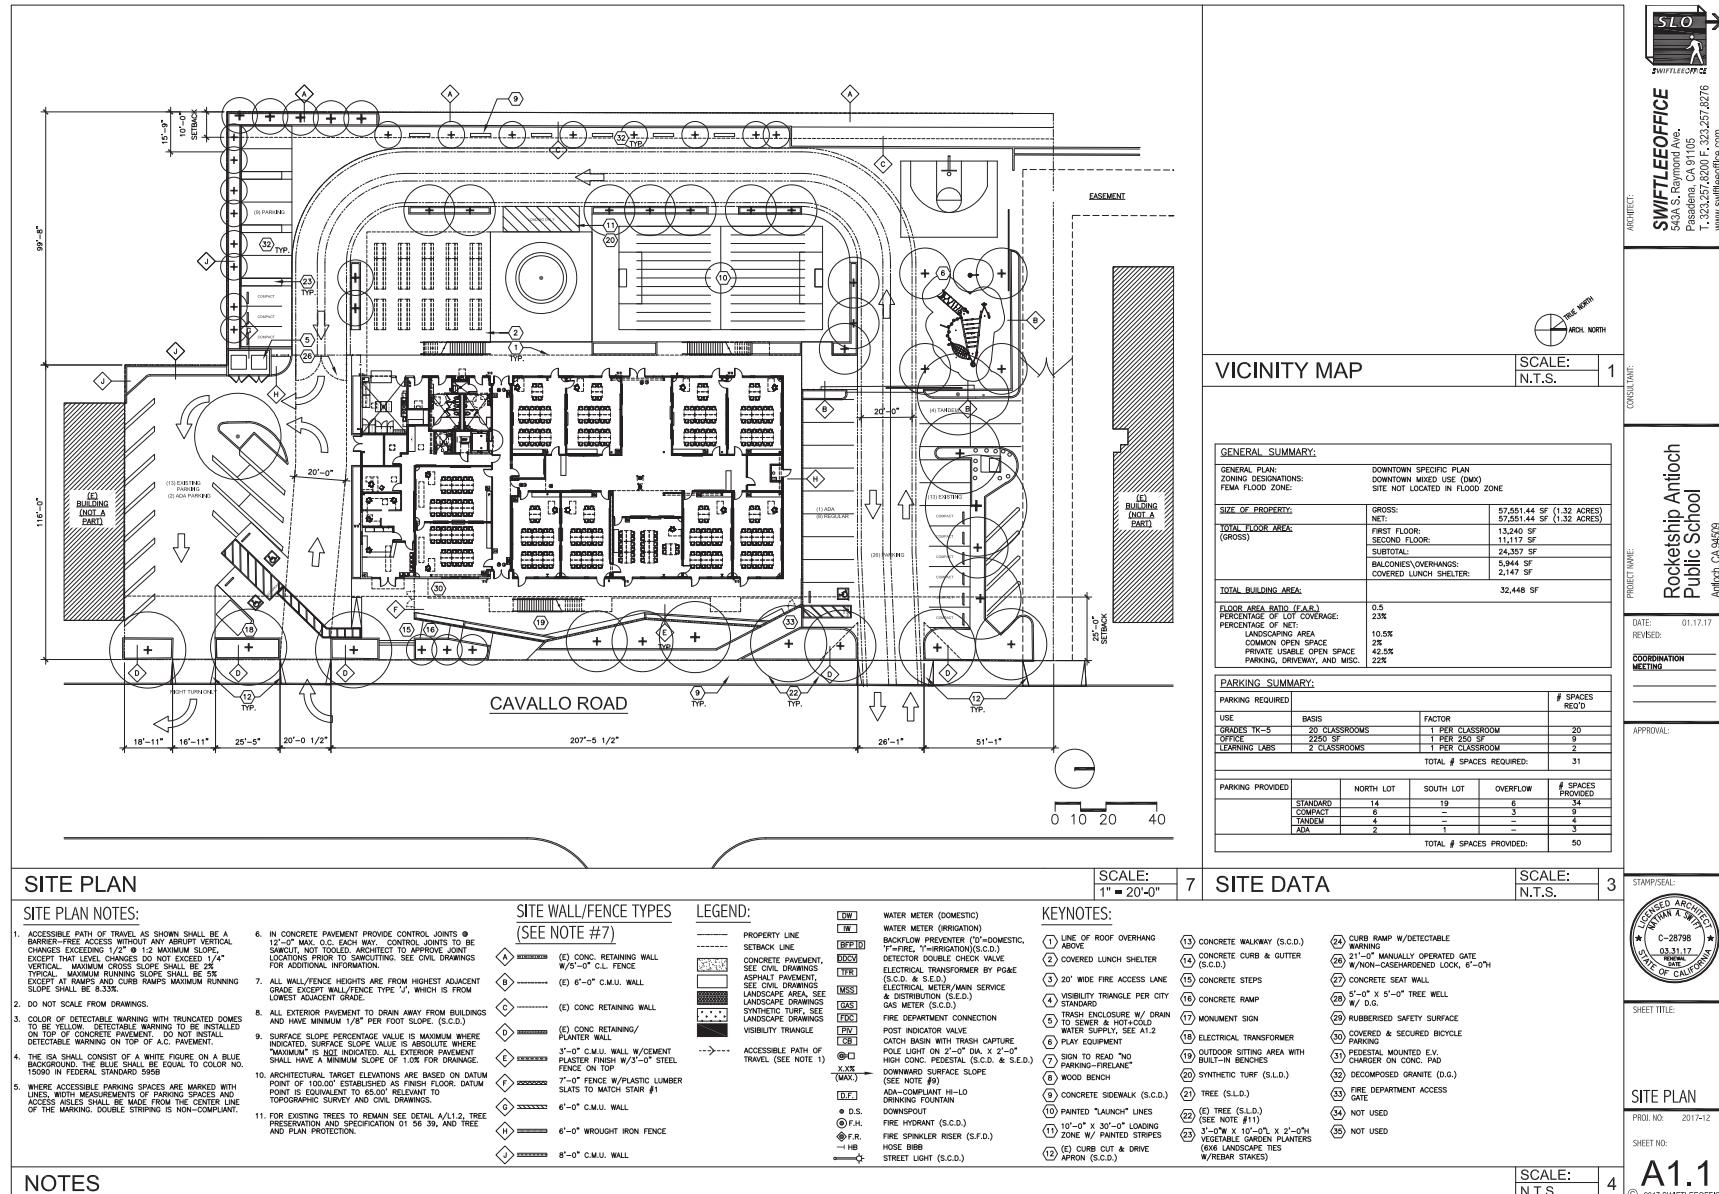

Figure 2 Project Site Plan

11. Hillcrest Avenue and East 18th Street *

* Denotes intersections on a route of regional significance

Per CCTA's *Technical Procedures*, a freeway segment level of service analysis is required when a project adds 50 trips or greater to a freeway segment. Because the proposed project is expected to generate less than 50 trips on any freeway segment, freeway segments were not evaluated.

Analysis Time Periods

Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak commute hours of traffic. Rocketship School activities would occur between 7:00 AM and 6:00 PM, with classes held between 7:30 AM and 4:30 PM on Monday, Tuesday, Wednesday, and Friday. On Thursdays, school start time would remain the same but dismissal would occur earlier at 2:15 PM, in order for teachers to have time for professional development after the students leave. On all school days, the morning student drop-off period would occur between 7:00 AM and 7:45 AM for all grades, while the afternoon pick-up periods would occur between 3:45 PM and 3:55 PM for TK and Kindergarten, between 4:00 PM and 4:10 PM for grades 1 and 2, and between 4:10 PM to 4:20 PM for grades 3, 4, and 5. Student pick-up for students in after-school programs would occur between 5:50 PM and 6:05 PM.

The peak hour of school traffic in the morning would coincide with the AM peak hour of commute traffic (generally between 7:00 and 9:00 AM). The peak hour of school traffic in the afternoon would coincide with the PM peak hour of commute traffic (typically between 4:00 and 6:00 PM). In addition, trips associated with after school programming would be added to the PM peak commute hour. It is during these peak commute periods that traffic is busiest and the impact on the roadway system by traffic from the school would be greatest.

Analysis Scenarios

Traffic conditions were evaluated for the following scenarios:

Scenario 1: Existing Conditions. Existing traffic volumes at study intersections were based on traffic counts conducted in April 2017. The study intersections were evaluated with a level of service analysis using Synchro software in accordance with the *2010 Highway Capacity Manual* methodology¹.

Scenario 2: Existing plus Project Conditions. Existing traffic volumes with the project were estimated by adding to existing traffic volumes the additional traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to determine the effects the project would have on the existing roadway network.

Scenario 3: Cumulative Conditions. Cumulative traffic volumes represent traffic growth through the year 2040. Cumulative traffic volumes were estimated based on the available year 2040 forecasts from the CCTA travel demand forecast model.

¹ The *2010 Highway Capacity Manual (HCM)* does not support turning movements with shared and exclusive lanes, and intersections with more than four approaches. Intersections with these features were analyzed using the *2000 HCM*.

Scenario 4: *Cumulative plus Project Conditions.* Cumulative plus project conditions were estimated by adding to the cumulative traffic volumes the additional traffic estimated to be generated by the proposed project. Cumulative plus project conditions were evaluated relative to cumulative conditions to determine potential project impacts.

Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts, previous traffic studies, CCTA, and field observations. The following data were collected from these sources:

- Existing traffic volumes,
- Existing lane configurations,
- Signal timing and phasing, and
- Year 2040 traffic volumes from the CCTA travel demand forecast model.

Level of Service Standards and Analysis Methodologies

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

Signalized Intersections

The City of Antioch evaluates level of service at signalized intersections based on the *2010 Highway Capacity Manual* (HCM) level of service methodology using Synchro software². The *2010 HCM* method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. The City of Antioch level of service standard for signalized study intersections is mid-level LOS D or better (average delay of 50 seconds or less), except on routes of regional significance, where the standard is high-level LOS D or better (average delay of 55 seconds or less). Wilbur Avenue, West 10th Street, and East 18th Street are all routes of regional significance. Thus, all of the signalized study intersections are subject to the high-level LOS D standard.

According to the East County Action Plan (ECAP), the multi-modal transportation service objective (MTSO) for suburban arterial routes is to maintain LOS D or better (average delay of 55 seconds or less) at all signalized intersections. The correlation between average control delay and level of service is shown in Table 1.

² The *2010 Highway Capacity Manual (HCM)* does not support turning movements with shared and exclusive lanes, and intersections with more than four approaches. Intersections with these features were analyzed using the *2000 HCM*.

Unsignalized Intersections

Level of service at the unsignalized study intersections was based on the *2010 Highway Capacity Manual* (2010 HCM) method using the Synchro software. This method is applicable for both two-way and all-way stop-controlled intersections. The two unsignalized study intersections have stop control on the minor street (East 13th Street) and no control on the major street ("A" Street and Cavallo Road). The levels of service reported for these intersections are based on the average delay of the worst stop-controlled approach. The unsignalized study intersections are not on a Route of Regional Significance, and are therefore subject to the mid-level LOS D standard (average delay of 30 seconds or less). The correlation between average control delay and LOS for unsignalized intersections is shown in Table 2.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	up to 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, *2010 Highway Capacity Manual*, (Washington, D.C., 2010).

Table 2**Unsignalized Intersection Level of Service Definitions Based on Delay**

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, 2010 *Highway Capacity Manual* (Washington, D.C., 2010).

Intersection Operations

For selected high-demand movements at key intersections, the estimated maximum vehicle queues were compared to the existing or planned storage capacity. The queuing analysis is presented for informational purposes only, since neither the City of Antioch nor the CMP have defined any policies related to queuing. Vehicle queues were calculated using a Poisson probability distribution, which estimates the probability of “n” vehicles for a vehicle movement using the following formula:

$$P(x = n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

P (x = n) = probability of “n” vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = Average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

Significance Criteria

Significance criteria are used to establish what constitutes an impact. Impacts on signalized intersections are based on the significance criteria and level of service standards of the jurisdiction in which the intersection is located. For this analysis, significance criteria for impacts on signalized

intersections are based on the City of Antioch and the ECAP level of service standards. As mentioned in the previous section, the City of Antioch and the ECAP level of service standard for intersections on routes of regional significance, is high-level LOS D or better (average delay of 55 seconds or less for signalized intersections and 35 seconds or less for unsignalized intersections). Intersections that are not on a route of regional significance are subject to the City's mid-level LOS D standard (average delay of 50 seconds or less for signalized intersections and 30 seconds or less for unsignalized intersections).

According to the City of Antioch, a development is said to create a significant adverse impact on traffic conditions at a study intersection if for either peak hour, any of the following conditions occurs:

1. The level of service at a signalized intersection on a route of regional significance degrades from an acceptable level (high-level LOS D or better with an average delay of 55 seconds or less) under no-project conditions to an unacceptable level (LOS E or F) under project conditions, or
2. The project will add traffic to a signalized intersection on a route of regional significance that operates at an unacceptable level (LOS E or F) under no-project conditions, or
3. The level of service at an unsignalized intersection that is not on a route of regional significance degrades from an acceptable level (mid-level LOS D or better with average delay of 30 seconds or less) under no-project conditions to an unacceptable level (high LOS D, or LOS E or F) under project conditions, and the intersection warrants a traffic signal based on the *California Manual of Uniform Traffic Control Devices* (CA MUTCD) Peak-Hour Signal Warrant (Warrant 3).

A significant impact is said to be satisfactorily mitigated when measures are implemented that would restore intersection conditions to its level of service standard or to an average intersection delay that is equal or better than no-project conditions.

Report Organization

The remainder of this report is divided into five chapters. Chapter 2 describes the existing roadway network, transit services, and pedestrian facilities. Chapter 3 describes the methods used to estimate project traffic and its impact on the existing transportation system. Chapter 4 describes cumulative conditions in the year 2040 and its impact on the transportation network, analyzed with and without project traffic. Chapter 5 presents the projects impacts on other transportation issues including an analysis of the site access and on-site circulation, student drop-off/pick-up circulation, vehicle queuing, and transit, bicycle, and pedestrian facilities. Chapter 6 includes a summary of project impacts, any proposed mitigation measures, and recommended improvements.

2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the site, including the roadway network, transit service, and pedestrian and bicycle facilities.

Existing Roadway Network

Regional access to the project site is provided via State Route 4 (SR 4).

SR 4 is an east/west freeway that extends from Hercules in Contra Costa County through San Joaquin, Calaveras, and Alpine Counties. In Antioch, SR 4 was recently widened to eight lanes, including two HOV lanes (one in each direction). SR 4 would provide access to and from the project site via interchanges at “A” Street and Hillcrest Avenue.

Local access within the study area is provided on “A” Street, East 18th Street, Cavallo Road, West 9th Street/Wilbur Avenue, West 10th Street/Beede Way, East 13th Street, Evergreen Avenue, and Hillcrest Avenue. These roadways are described below.

“A” Street is a north/south arterial roadway that extends from SR 4 to West 3rd Street, where it transitions into West 2nd Street. “A” Street is a designated route of regional significance south of East 18th Street. In the vicinity of the project site, “A” Street is a four-lane roadway with on-street parking.

East 18th Street is an east/west arterial roadway that extends from “L” Street to SR 160. East 18th Street is a designated route of regional significance between “A” Street and SR 160. In the vicinity of the project site, East 18th Street is a four-lane roadway with a center turn lane.

Cavallo Road is a north/south collector that extends from Wilbur Avenue south to East Tregallas Road, where it transitions into Garrow Drive. In the vicinity of the project site, Cavallo Road is a three-lane roadway with one lane in each direction of travel and a center turn lane. On-street parking and bike lanes exist intermittently along both sides of the street. Cavallo Road runs along the eastern project boundary and provides direct access to the Rocketship School site.

West 9th Street/Wilbur Avenue is an east/west arterial roadway that extends from “O” Street to the eastern city limits east of SR 160. West 9th Street/Wilbur Avenue is a designated route of regional significance west of SR 160. In the vicinity of the project site, Wilbur Avenue is a four-lane roadway while West 9th Street is a two-lane roadway.

West 10th Street/Beede Way is an east/west arterial roadway that extends from Shady Lane to the western city limits, where it transitions into Pittsburg-Antioch Highway. West 10th Street is a designated

route of regional significance. In the vicinity of the project site, West 10th Street/Beede Way is a two-lane roadway with on-street parking.

East 13th Street is an east/west local collector that extends from “A” Street to Cavallo Road. East 13th Street primarily serves the immediate residential neighborhoods surrounding the Kimball Elementary School. East 13th Street is a two-lane roadway with on-street parking.

Evergreen Avenue is a two-lane north/south local street with on street parking on both sides. It extends from East 18th Street south to Belshaw Street.

Hillcrest Avenue is primarily a four-lane north/south arterial roadway that extends from Prewett Ranch Drive north to Jacobsen Street. Hillcrest Avenue is a designated route of regional significance south of SR 4.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. In the project vicinity, sidewalks exist along both sides of “A” Street, East 18th Street, Cavallo Road, West 9th Street/Wilbur Avenue, West 10th Street/Beede Way, East 13th Street, Evergreen Avenue, and Hillcrest Avenue, providing pedestrian access to and from the project site. Marked crosswalks with pedestrian signal heads and push buttons are provided at all approaches of the signalized study intersections, except on the west leg of the East 18th Street/Evergreen Avenue intersection. At the unsignalized study intersections, marked crosswalks are provided along all stop-controlled approaches. Although one crosswalk connection is missing on East 18th Street at Evergreen Avenue, the overall network of sidewalks and crosswalks in the study area has good connectivity and provides students, parents, and staff with safe routes to the proposed school, nearby transit stops, and other points of interest in the vicinity of the project site.

There are several bicycle facilities in the vicinity of the project site. The existing bicycle facilities within the study area are described below, and are shown on Figure 3.

Class I Bikeway/Trail is an off-street path with exclusive right-of-way for non-motorized transportation used for commuting as well as recreation. The Delta de Anza Regional Trail is a paved, multi-use trail approximately two miles south of the project site that currently spans over 15 miles of the planned 25-mile length. The trail generally follows the East Bay Municipal Utility District's corridor and the Contra Costa Water District's canal, and once completed, will connect the Cities of Concord, Bay Point, Pittsburg, Antioch, and Oakley as well as provide access to Contra Loma Regional Park. Access to the Delta de Anza Regional Trail from the project site is provided via Hillcrest Avenue.

Class II Bike Lanes are preferential use areas within a roadway designated for bicycles. Within the vicinity of the project, Class II bikeways are present along both sides Wilbur Avenue between “A” Street and Wilbur Lane, Cavallo Road between Wilbur Avenue and East 18th Street, and Hillcrest Avenue between East 18th Street and Prewett Ranch Drive. There is also a bike lane on one side of Lake Drive and Hillcrest Avenue that facilitates bike travel in clockwise loop around Lake Alhambra.

Class III Bike Routes are signed bike routes that provide a connection through residential, downtown, and rural/hillside areas to Class I and Class II facilities. Bike routes serve as transportation routes within neighborhoods to parks, schools, and other community amenities. Although none of the residential streets near the project site (e.g., East 13th Street, Noia Avenue, and East 14th Street) are designated as bike routes, due to their low traffic volumes, many of them are conducive to bicycle usage.

Figure 3
Existing Bicycle Facilities

Existing Transit Service

Existing transit service near the project site is provided by the Eastern Contra Costa Transit Authority (Tri Delta Transit). The study area is served directly by eight local bus routes. Bus lines that run through the study area are summarized in Table 3, illustrated in Figure 4, and described below.

Table 3
Existing Transit Services

Bus Route	Route Description	Headway ¹
Local Route 380	Pittsburg/Bay Point BART Station to Tri Delta Transit Station	30 - 35 min
Local Route 383	Antioch Park & Ride to Lone Tree Way/Hillcrest Ave.	60 min
Local Route 387	Pittsburg/Bay Point BART Station to Tri Delta Transit Station	60 min
Local Route 388	Pittsburg/Bay Point BART Station to Deer Valley Kaiser Medical Center	45 - 55 min
Local Route 391	Pittsburg/Bay Point BART Station to Brentwood Park & Ride	35 - 40 min
Local Route 392 *	Pittsburg/Bay Point BART Station to Antioch Park & Ride	60 min
Local Route 393 *	Mariners Cover/Pacifica to Brentwood Park & Ride	60 min
Local Route 394 *	Pittsburg/Bay Point BART Station to Antioch Park & Ride	60 min

Notes:

* Route operates only on weekends.

¹ Approximate headways during peak commute periods.

Local Route 380 operates on East 18th Street and Cavallo Road in the vicinity of the project. Route 380 operates between the Pittsburg/Bay Point BART Station and the Tri Delta Transit Station, with the closest bus stops located adjacent to the project site on Cavallo Road at Amber Drive and East 18th Street, approximately 500 feet from the project site. Weekday service is provided from approximately 3 AM to 11 PM with 30- to-35-minute headways during commute hours.

Local Route 383 operates primarily north-south on Hillcrest Avenue in the vicinity of the project site. Route 383 runs between the Antioch Park & Ride lot and the Lone Tree Way/Hillcrest Avenue intersection. The closest bus stop is located on East 18th Street at the Hillcrest Avenue intersection, approximately 0.6 miles from the project site. Service is provided from approximately 7 AM to 5 PM with 60- to-90-minute headways during commute hours.

Local Route 387 operates east-west primarily on Wilbur Avenue, between the Pittsburg/Bay Point BART Station and the Tri Delta Transit Station. The closest stops are located at the intersection of Cavallo Road and Wilbur Avenue, which is about a half mile from the project site. Weekday service is provided from approximately 5 AM to 9 PM, with 60-minute headways during commute hours.

Local Route 388 operates on “A” Street and East 18th Street in the vicinity of the project site, and runs between the Pittsburg/Bay Point BART Station and the Deer Valley Kaiser Medical Center. The closest bus stops are located at the intersection of Cavallo Road and East 18th Street, which is less than 1,000 feet from the project site. Weekday service is provided from approximately 5:30 AM to 11:30 PM with 45- to 55-minute headways during commute hours.

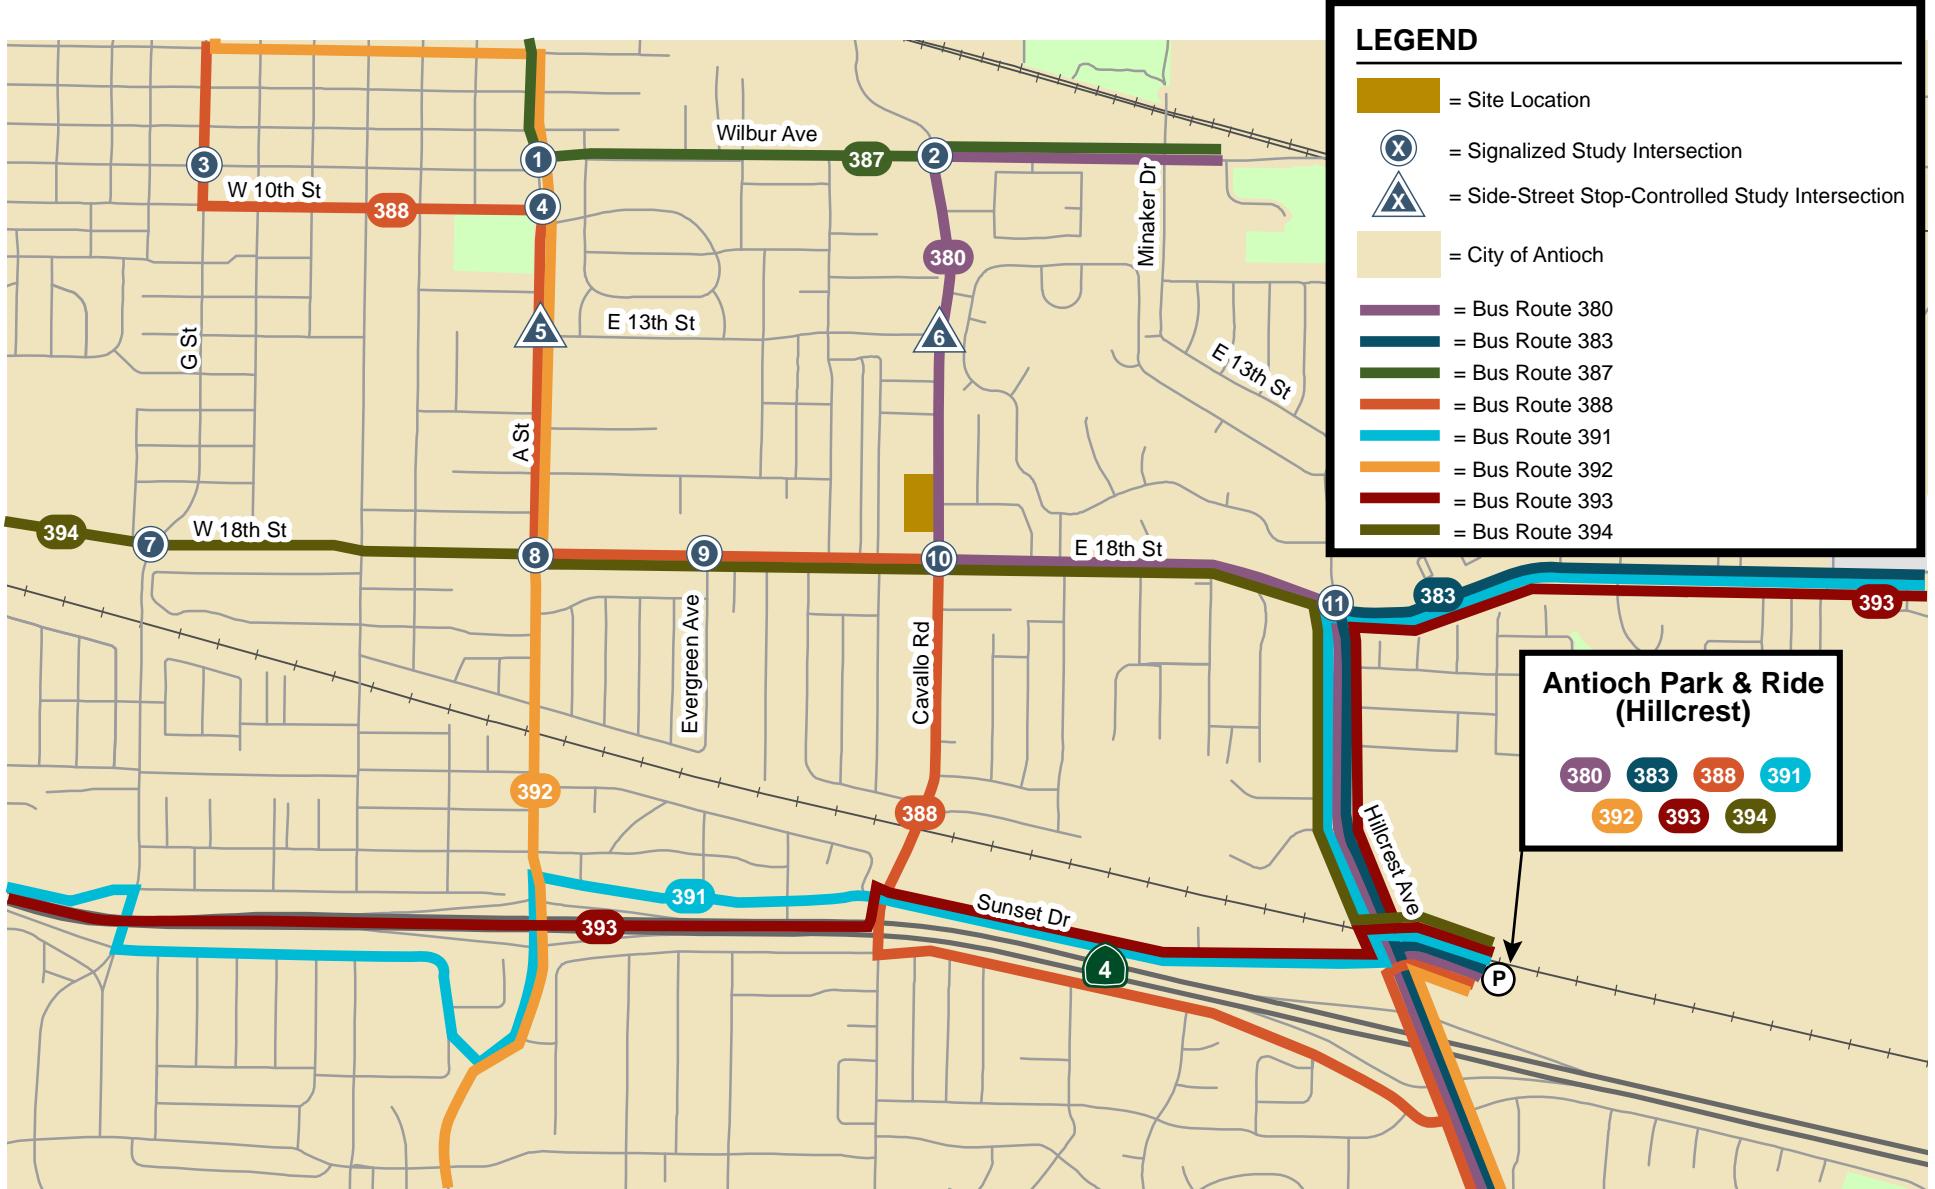

Figure 4
Existing Transit Services

Local Route 391 operates on Hillcrest Avenue in the vicinity of the project, and runs between the Pittsburg/Bay Point BART Station and the Brentwood Park & Ride lot. The closest stops are located at the intersection of Hillcrest Avenue and East 18th Street, which is about 0.6 miles from the project site. Weekday service is provided from approximately 6 AM to 1 AM (next day), with 35- to-40-minute headways during commute hours.

Local Route 392 operates on “A” Street in the vicinity of the project, and runs between the Pittsburg/Bay Point BART Station and the Antioch Park & Ride lot. The closest bus stops are located on “A” Street at the East 13th Street and East 16th Street intersections, which are about one half-mile from the project site. Service is provided only on weekends from approximately 5 AM to 2 AM (next day) with about 60-minute headways.

Local Route 393 operates on Hillcrest Avenue in the vicinity of the project, and runs between Mariners Cove/Pacifica and the Brentwood Park & Ride lot. The closest stops are located at the intersection of Hillcrest Avenue and East 18th Street, which is about 0.6 miles from the project site. This route operates on weekends only from approximately 5 AM to 2 AM (next day), with about 60-minute headways.

Local Route 394 operates east-west on Hillcrest Avenue in the vicinity of the project, and runs between the Pittsburg/Bay Point BART Station and the Antioch Park & Ride lot. The closest stops are located at the intersection of Hillcrest Avenue and East 18th Street, which is about 0.6 miles from the project site. This route operates on weekends only from approximately 7 AM to 9 PM, with about 60-minute headways.

Existing Intersection Lane Configurations

The existing lane configurations at the study intersections were determined by observations in the field and are shown on Figure 5.

Existing Traffic Volumes

Existing traffic volumes at nine study intersections were obtained from peak-hour counts collected on April 6th, 2017. AM peak-hour traffic volumes at two study intersections (“G” Street/10th Street and the “G” Street/18th Street) are based on Spring 2016 counts conducted for the Antioch High School Street Closure Traffic Study. However, the previous traffic analysis did not analyze the PM peak commute hours from 4 to 6 PM. Therefore, new turning-movements counts were conducted at these intersections in June 2017 and seasonally adjusted to reflect typical traffic volumes when Antioch schools are in session. The existing peak-hour intersection volumes are shown in Figure 6. It should be noted that at the intersection of “A” Street and East 13th Street, the traffic counts recorded vehicles illegally turning left into the outbound-only driveway of the Higgins Chapel property. Intersection turning-movement counts conducted for this analysis are presented in Appendix A.

Rocketship Antioch

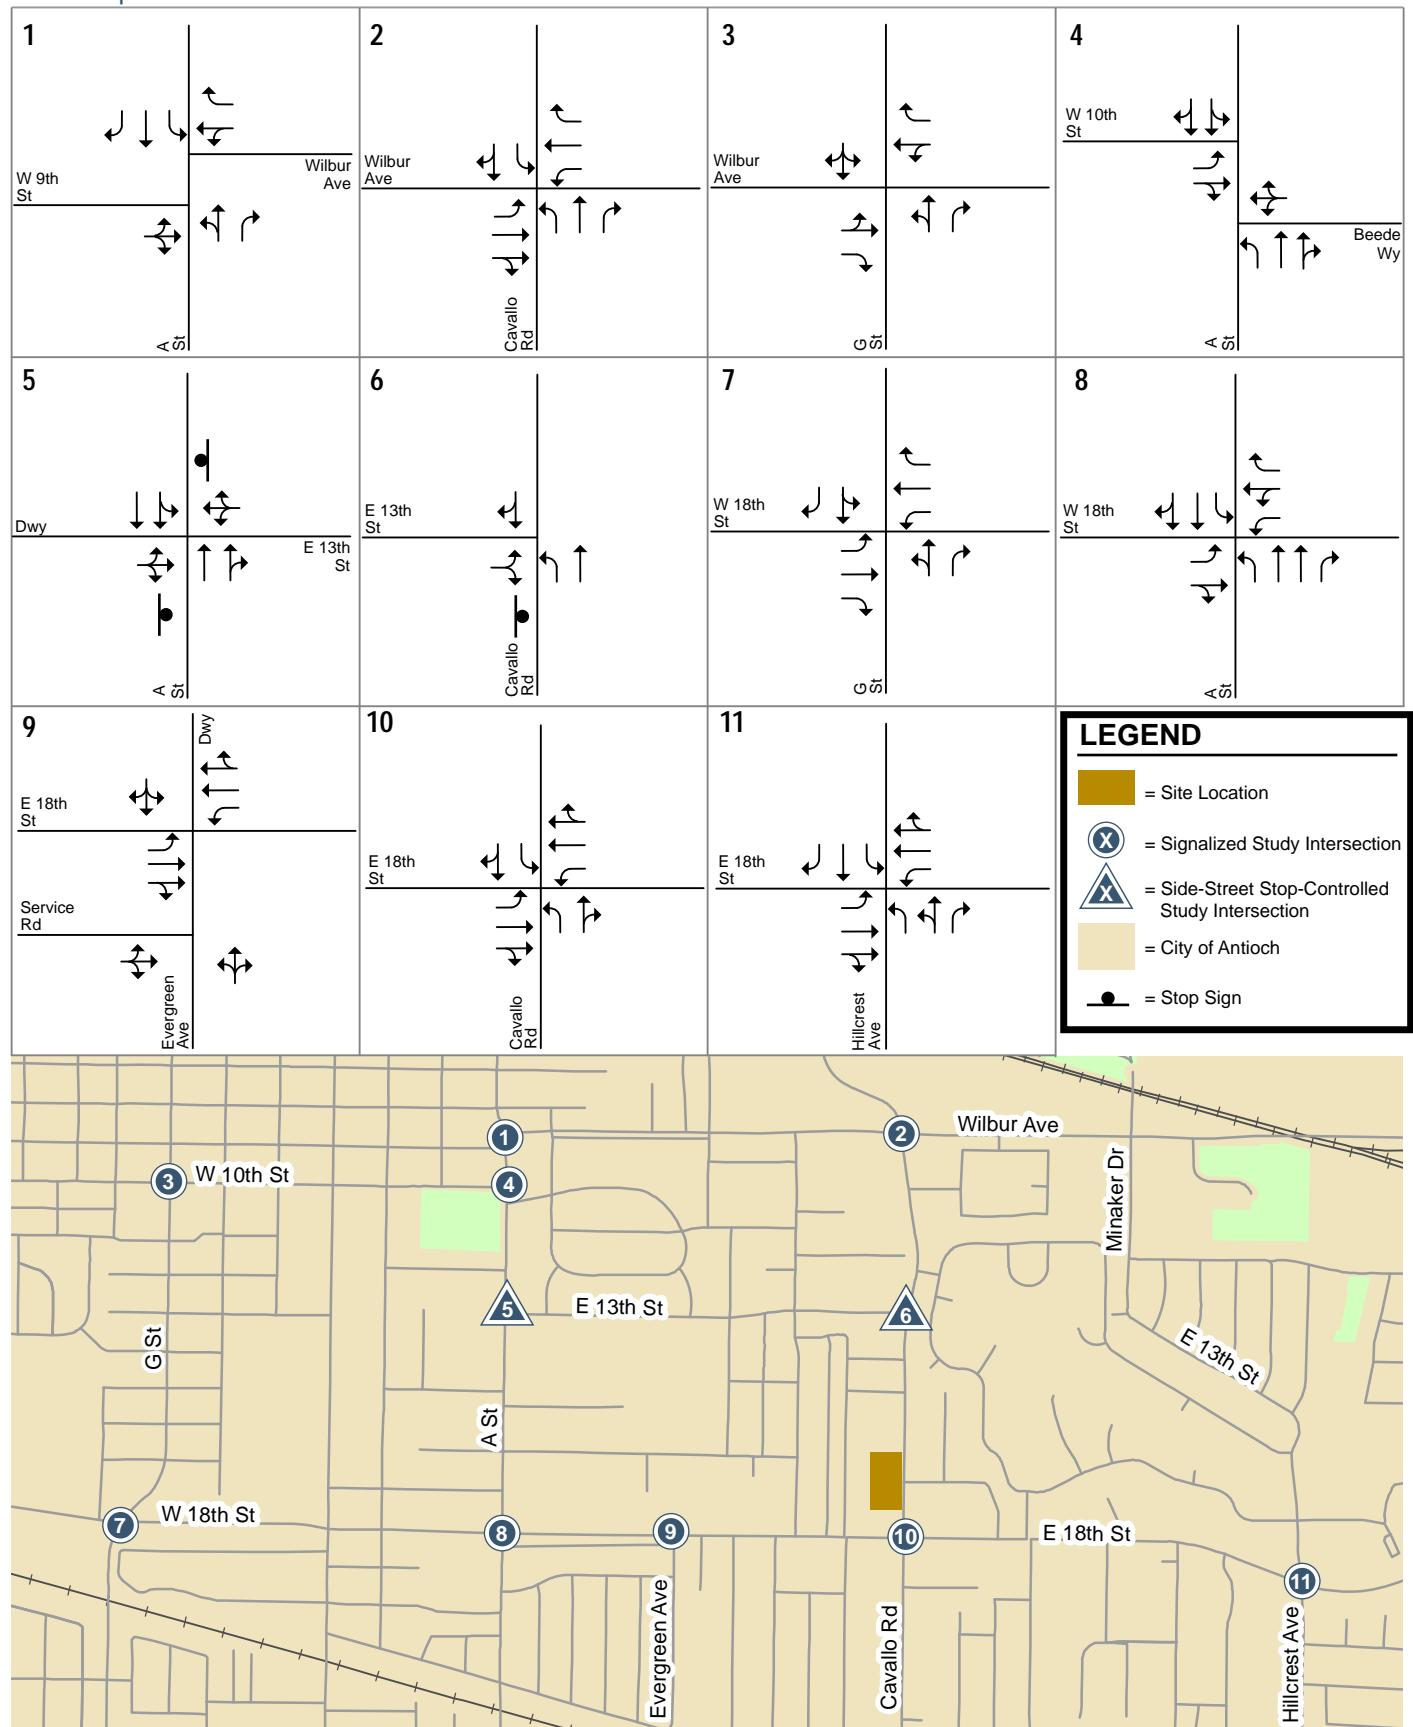

Figure 5
Existing Lane Configurations

Rocketship Antioch

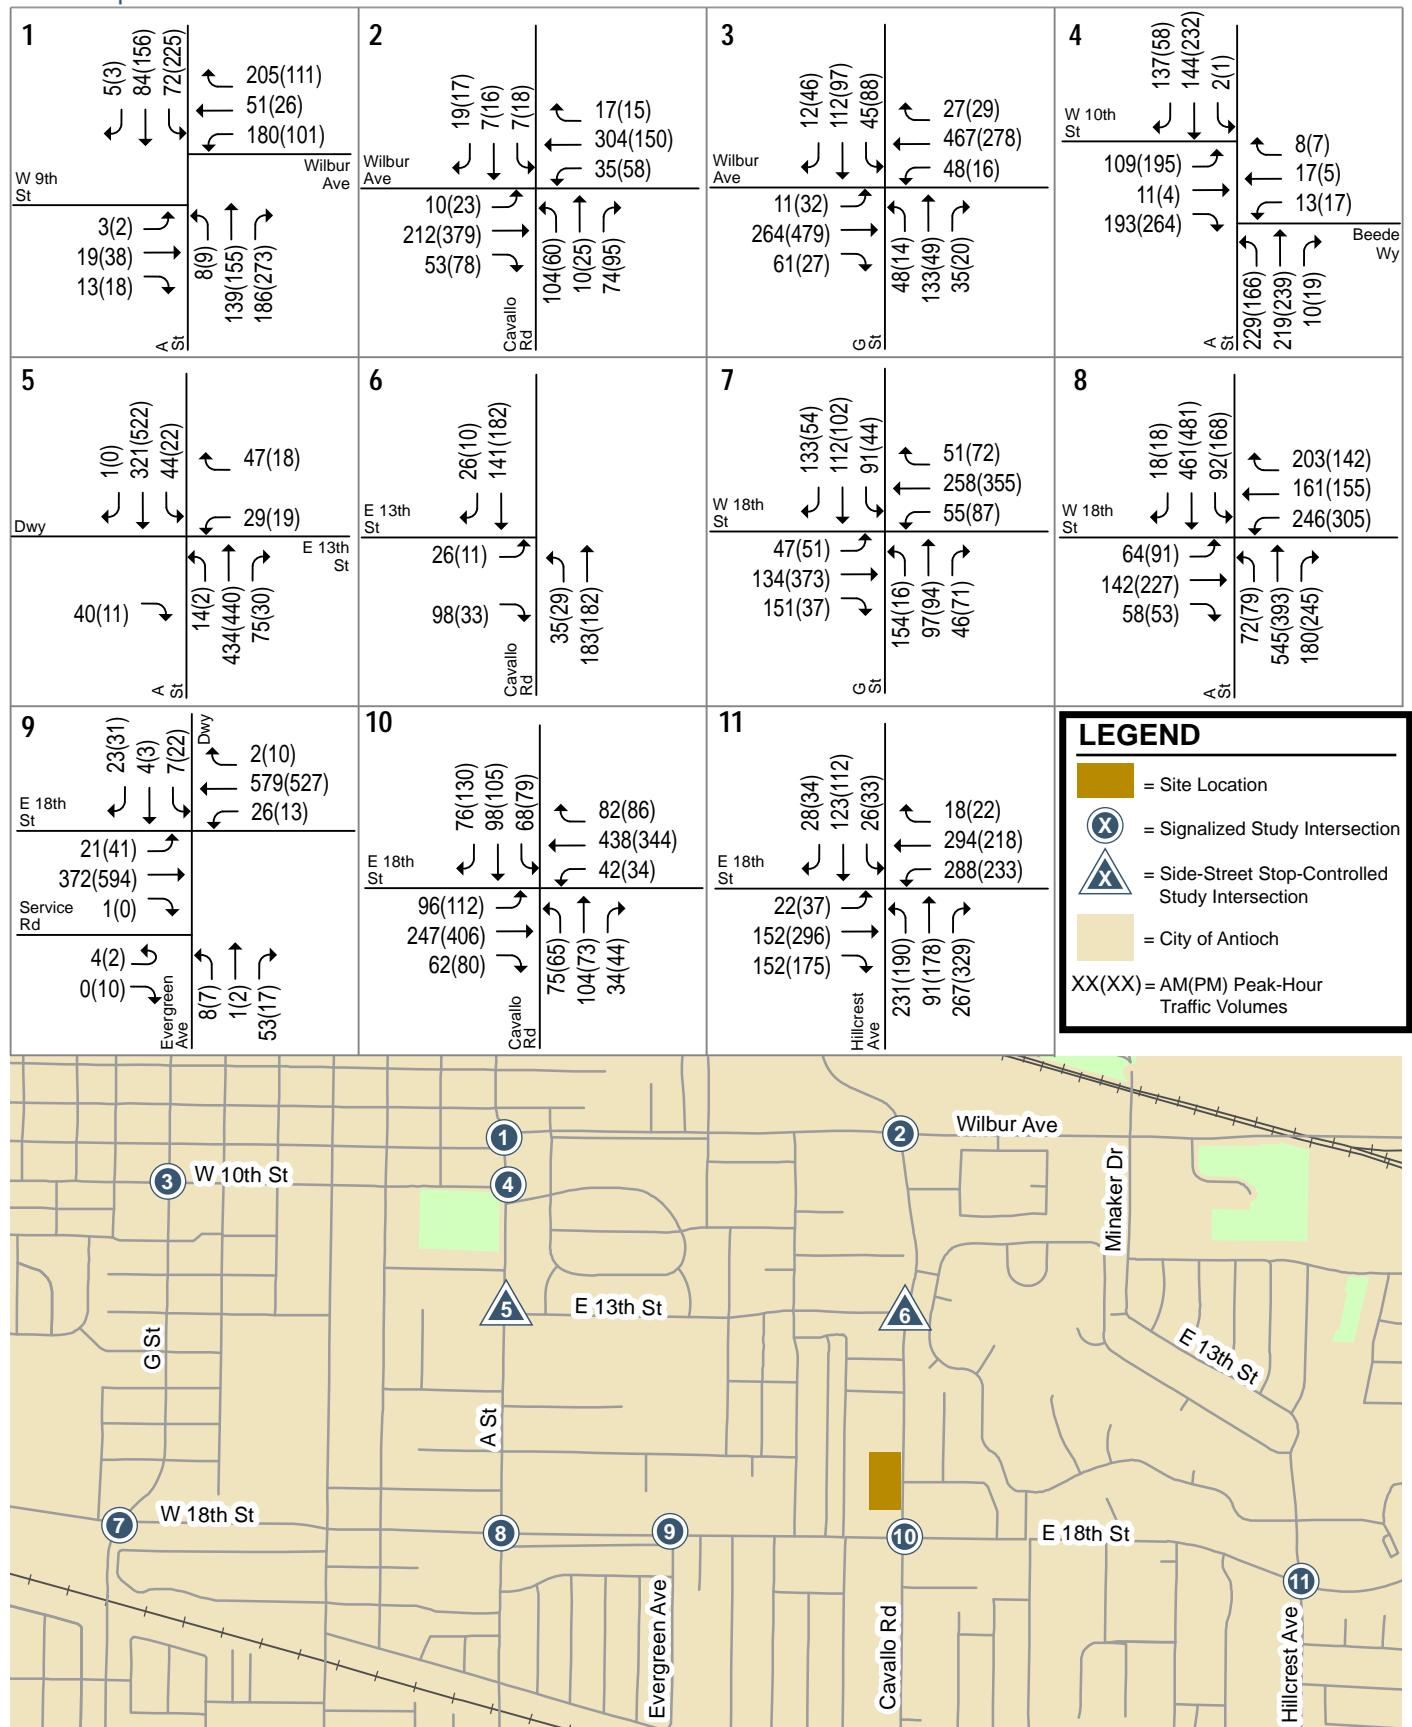

Figure 6
Existing Traffic Volumes

Existing Intersection Levels of Service

Intersection levels of service were evaluated against the City of Antioch and ECAP standards. The results of the analysis show that all of the signalized study intersections currently operate at an acceptable level of service (high-level LOS D or better) during both the AM and PM peak hours.

The stop-controlled East 13th Street approaches to “A” Street and Cavallo Road currently operate at LOS B during both peak hours, which complies with the City’s mid-level LOS D standard for intersections not on a Route of Regional Significance. The favorable level of service at the “A” Street intersection can be attributed to the relatively low left-turn volumes and the four-lane cross section on “A” Street. At the Cavallo Road intersection, a left-turn lane on northbound Cavallo Road allows turning vehicles to wait for a gap in on-coming traffic without disrupting the flow of northbound through traffic. Furthermore, the center turn lane in the median of Cavallo Road allows the left turn from eastbound East 13th Street to northbound Cavallo Road to be completed in two stages. Vehicles can cross southbound Cavallo Road and then stop in the center turn lane while waiting for a gap in the northbound traffic flow.

Results of the intersection LOS analysis under existing conditions are summarized in Table 4. The intersection levels of service calculation sheets are included in Appendix C.

Observed Existing Traffic Conditions

Traffic conditions in the field were observed in order to identify existing operational deficiencies and to confirm the accuracy of calculated intersection levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to level of service, and (2) to identify any locations where the level of service analysis does not accurately reflect existing traffic conditions.

Overall, most study intersections operated adequately during both the AM and PM peak hours of traffic, and the level of service analysis appears to accurately reflect actual existing traffic conditions. However, field observations showed that some operational problems currently occur during the PM peak commute hour. These issues are described below.

“A” Street and East 18th Street

During the PM peak hour, congestion on northbound “A” Street extends to the upstream intersection of Belshaw Street, causing vehicles to wait through at least two signal cycles to clear the intersection. Queues in both the eastbound and westbound through lanes occasionally extend beyond the end of their respective left-turn pocket, causing minor delays for vehicles trying to turn access the left-turn pockets. However, the signal’s split phase allows all vehicles on these approaches to clear within one signal cycle. During the AM peak hour, there were no observed operational issues.

Table 4
Existing Intersection Levels of Service

Study Number	Intersection	Peak Hour	Control Type	Existing Conditions

Notes:

TWSC = Two-Way Stop Control

* Denotes an intersection on a Route of Regional Significance

¹ For TWSC intersections, the worst approach's delay and level of service are reported.

² PM counts were seasonally adjusted to reflect traffic when Antioch schools are in session.

³ The *Highway Capacity Manual* (HCM) 2010 does not support turning movements with shared and exclusive lanes. Therefore, this intersection was analyzed using the HCM 2000.

Bold indicates a substandard level of service.

Bold indicates a significant project impact.

3. Existing Plus Project Conditions

This chapter describes traffic conditions with the project. It begins with a description of the transportation system under existing plus project conditions and the method by which project traffic is estimated. A summary of levels of service under existing plus project traffic conditions is presented in this chapter. Existing plus project conditions are represented by existing traffic conditions with the addition of traffic generated by the project.

Transportation Network under Existing Plus Project Conditions

It is assumed in this analysis that the transportation network under existing plus project conditions would be the same as the existing transportation network.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear were estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic traveling to and from the project was estimated for the AM and PM peak hours. As part of the project trip distribution, the directions to and from which the project trips would travel were estimated. In the project trip assignment, the project trips were assigned to specific streets and intersections. These procedures are described below.

Trip Generation

The trip generation rates for the proposed school are based on counts Hexagon Transportation Consultants, Inc. conducted at existing Rocketship Schools in San Jose between 2012 and 2014. All of the surveyed schools have similar enrollment size and school hours as the proposed new Rocketship school in Antioch. The observed trip generation rates are presented in Table 5. The trip generation rates at Rocketship Schools in San Jose are significantly higher than the elementary school trip rates published in the Institute of Transportation Engineers' *Trip Generation Manual, 9th Edition*. The magnitude of traffic generated by the proposed school was estimated by multiplying the observed Rocketship School trip generation rates by the proposed enrollment (600 students). Given that the existing building on the site is currently vacant, no credits or reductions were assumed for the trips generated from the previous use.

The proposed Rocketship school will implement a Transportation Demand Management (TDM) Program that will encourage students and employees to carpool, take transit, or use active modes of transport to get to and from school. Proposed TDM measures include carpool matching, financial incentives for parents who carpool, and a ride-share allowance for staff members who live within two

miles of the project site. The TDM program is expected to reduce the vehicle trips and parking demand generated by the proposed school compared to that observed at other Rocketship schools in San Jose, which do not have similar TDM programs. To be conservative, this report assumes no trip reductions for TDM measures. It should also be noted that while the trips generated by the proposed school would be new to the roadways immediately adjacent to the project site, in a regional context, the Rocketship school trips would be merely reassigned trips from other schools in the area where the students would have otherwise attended. However, to be conservative, project trips were added to the roadway network without reassigning existing vehicle trips associated with the nearby elementary schools (i.e. Kimball Elementary School, Fremont Elementary School, Belshaw Elementary School).

Table 5
Trip Generation Rate Comparison

Land Use	Enrollment	Trip Rate (vehicle trips per student)		
		Daily ⁷	AM Peak Hour	PM Peak Hour ⁸
Observed				
Rocketship Si Se Puede Academy ¹	508 Students	2.60	0.91	0.37
Rocketship Mateo Sheedy Elementary ²	591 Students	2.51	0.88	0.39
Rocketship Brilliant Minds ³	607 Students	3.34	1.17	0.68
Rocketship Discovery Prep ⁴	482 Students	1.99	0.69	0.44
Rocketship Mosaic Elementary ⁵	583 Students	3.31	1.16	0.70
Rocketship Average	554 Students	2.75	0.96	0.52

<u>Notes</u>				
¹	Based on Hexagon Transportation Consultants survey conducted at Rocketship Si Se Puede Academy on 12/4/12.			
²	Based on Hexagon Transportation Consultants survey conducted at Rocketship Mateo Sheedy Elementary on 11/27/12.			
³	Based on Hexagon Transportation Consultants surveys conducted at Rocketship Brilliant Minds Academy on 9/17/13 and 10/4/13 .			
⁴	Based on Hexagon Transportation Consultants survey conducted at Rocketship Discovery Prep on 10/28/14 .			
⁵	Based on Hexagon Transportation Consultants survey conducted at Rocketship Mosaoc Elementary on 10/29/14 .			
⁶	Source: <i>Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition</i> , Elementary School (ITE Land Use #520).			
⁷	Observed daily trip rate w as estimated by multiplying the AM peak hour rate by the ratio of daily trip rate to the AM trip rate (1.29/.45) available in the <i>Institute of Transportation Engineers (ITE) Trip Generation Manual, 8th Edition</i> for Elementary School (ITE Land Use #520).			
⁸	PM peak hour trip generation reflects 4 PM - 5 PM, w hich is w hen peak project traffic and peak background traffic overlap.			

The trip generation estimates are presented in Table 6. Based on the surveyed trip generation rates and an enrollment of 600 students, the project would generate 1,650 daily trips, 578 trips (314 inbound and 264 outbound) during the AM peak hour, and 314 trips (128 inbound and 186 outbound) during the PM peak hour.

Trip Distribution and Assignment

The trip distribution pattern for the project was estimated based on existing travel patterns on the surrounding roadway network and the school's anticipated attendance area. It is anticipated that

Rocketship will draw some students from other public elementary schools in the vicinity including Kimball Elementary School, Fremont Elementary School, and Belshaw Elementary School. However, as previously stated, the traffic analysis is conservative in that Rocketship trips were merely added to existing traffic volumes without any reassignment of existing elementary school trips. The trip distribution pattern for the project is shown on Figure 7. Project trips were assigned based on the directions of approach and departure, as well as the roadway network connections in accordance with the project trip distribution pattern. The project trip assignment at each study intersection is shown graphically on Figure 8.

Table 6
Project Trip Generation Estimates

Land Use	Size	Daily		AM Peak Hour				PM Peak Hour ²			
		Rate ³	Trips	Rate	In	Out	Total	Rate	In	Out	Total
Proposed Use											
Elementary School ¹	600 Students	2.75	1,650	0.963	314	264	578	0.523	128	186	314
<u>Notes</u>											
¹ Peak hour trip rates (per student) based on Hexagon Transportation Consultants surveys conducted in 2012 through 2014 at five Rocketship elementary schools in San Jose.											
² PM peak hour trip generation reflects 4 PM - 5 PM, which is when peak project traffic and peak background traffic overlap.											
³ Daily trip rate was derived by multiplying the AM peak hour rate by the ratio of daily trip rate to the AM trip rate (1.29/.45) available in the <i>Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition</i> for Elementary School (ITE Land Use #520).											

Existing Plus Project Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to existing traffic volumes to obtain existing plus project traffic volumes. Existing plus project conditions were evaluated relative to existing conditions in order to determine potential project impacts. The existing plus project traffic volumes are shown on Figure 9. A tabular summary of project traffic at each study intersection is contained in Appendix B.

Existing Plus Project Intersection Analysis

The results of the intersection level of service analysis under existing plus project conditions are summarized in Table 7. The results show that all of the signalized study intersections would continue to operate at acceptable levels of service (high-level LOS D or better).

The worst stop-controlled approaches at both unsignalized study intersections would operate at LOS C or better under existing plus project conditions during both peak hours, which complies with the City's mid-level LOS D standard for intersections not on a route of regional significance.

Therefore, this intersection was analyzed using the HCM 2000.**Bold** indicates a substandard level of service.**Bold** indicates a significant project impact.

4. Cumulative Conditions

This chapter presents a summary of the traffic conditions that would occur under cumulative conditions with the proposed project. Cumulative conditions represent future traffic conditions with expected growth in the area. Cumulative traffic volumes were estimated using forecasts developed from Contra Costa County's travel demand forecast model. Cumulative conditions reflect a horizon year of 2040.

Roadway Network and Traffic Volumes

The intersection lane configurations under cumulative conditions were assumed to be the same as described under existing conditions.

Cumulative volumes at the study intersections were estimated based on year 2040 traffic volumes from the County's travel demand forecast model. The County's travel demand forecast model assumes the completion of the upcoming East Contra Costa Bay Area Rapid Transit (eBART) extension, which will add 10 miles of eBART track from the Pittsburg/Bay Point BART Station to a new Antioch station at Hillcrest Avenue. As a result, the travel demand forecast model assumes a shift in mode choice within the Pittsburg/Antioch areas. Trips that currently use arterials streets or SR 4 are expected to access the Hillcrest Avenue eBART station. This shift in mode choice is reflected in the decrease of traffic volumes on selected study area roadways, particularly along "A" Street and West 10th Street/Wilbur Avenue. To be conservative, for the intersection approaches where the model estimates traffic volumes to be lower than the existing traffic count, traffic volumes for that approach were assumed to remain the same as under existing conditions.

Cumulative plus project traffic volumes were estimated by adding to the cumulative traffic volumes the additional traffic estimated to be generated by the project. Cumulative plus project conditions were evaluated relative to cumulative conditions to determine potential project impacts. Figures 10 and 11 show the intersection turning-movement volumes under cumulative conditions without and with the project. A tabular summary of project traffic at each study intersection is contained in Appendix B.

Rocketship Antioch

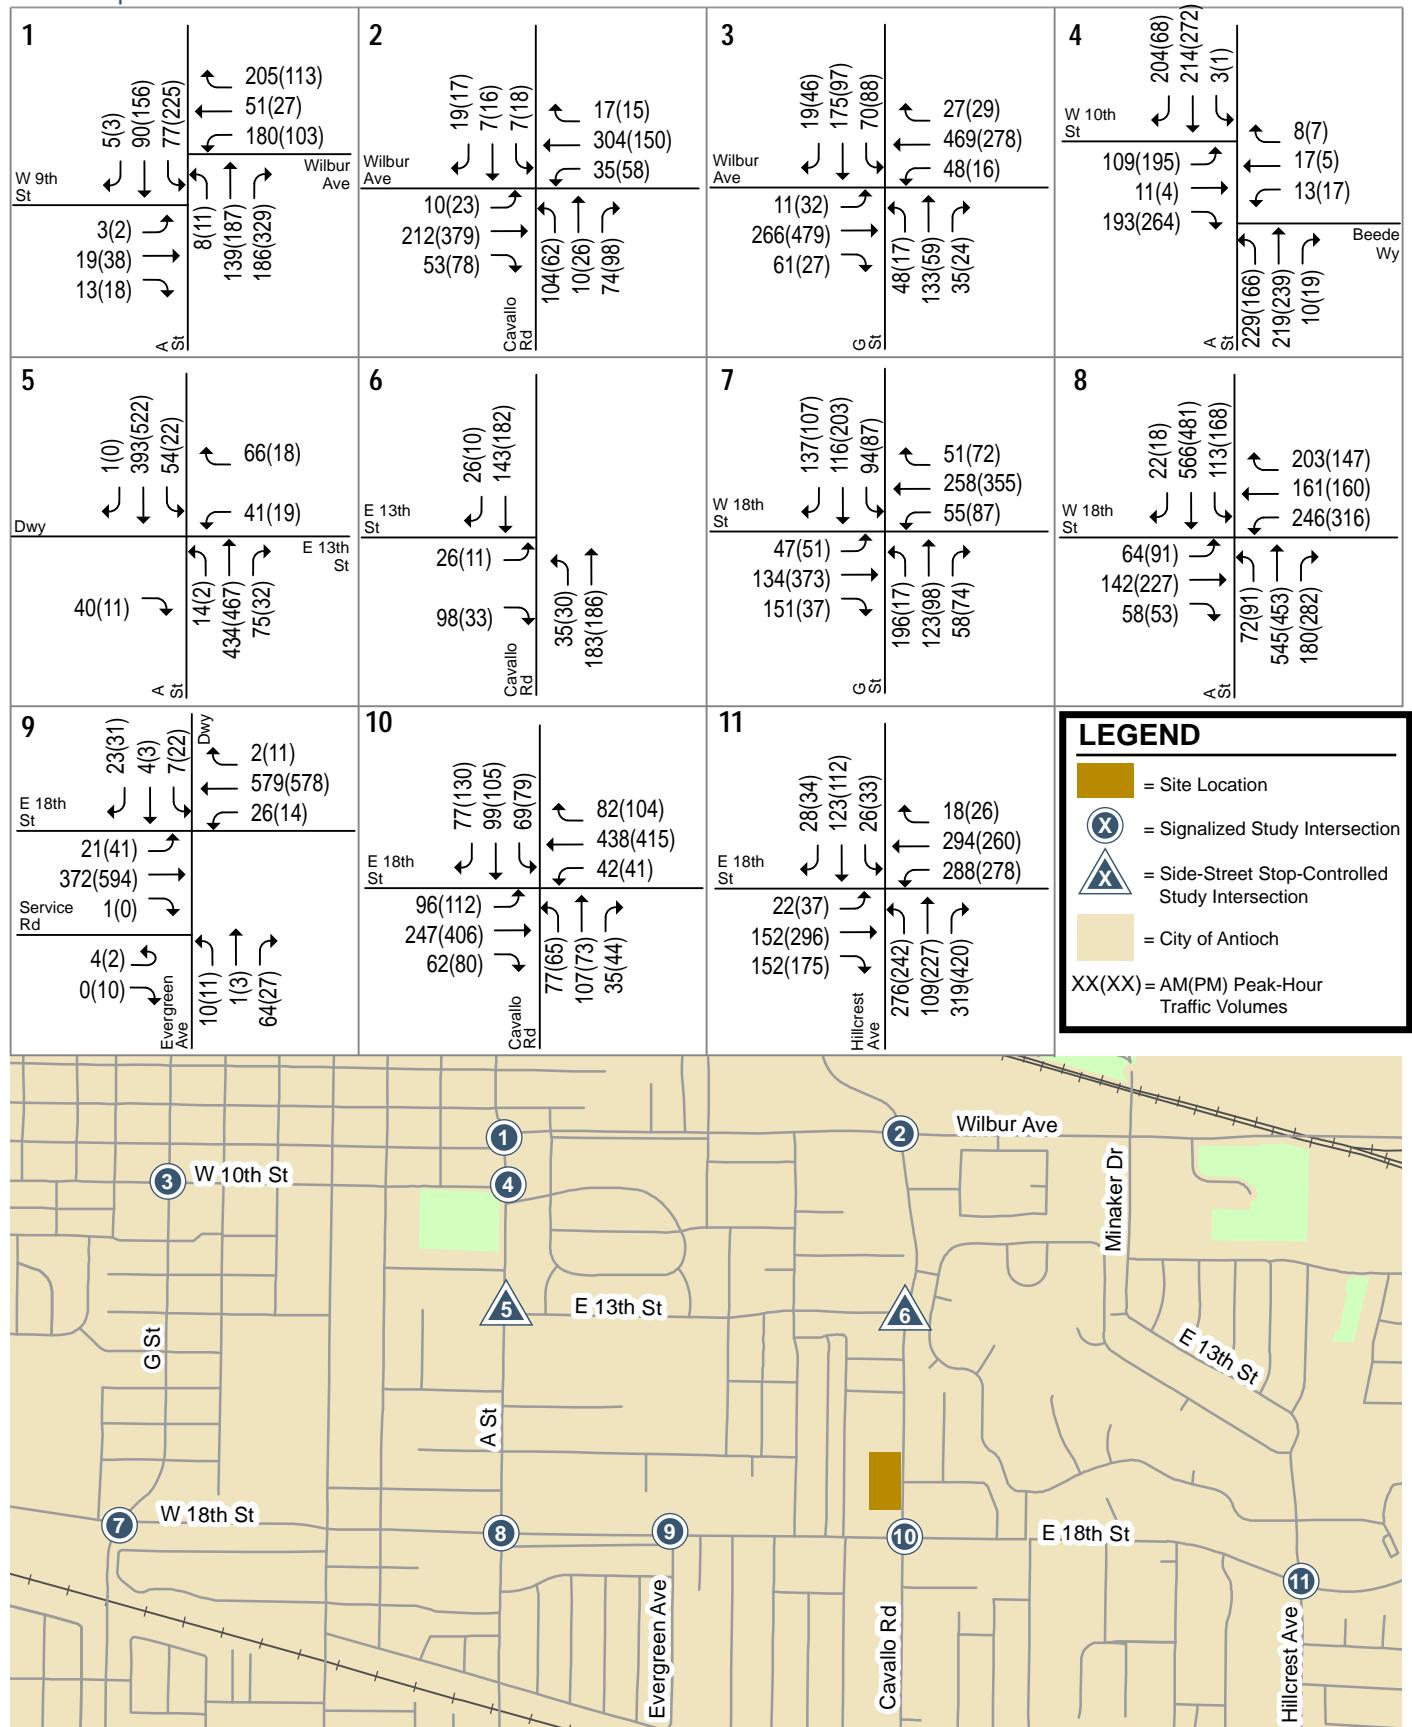

Figure 10
Cumulative Traffic Volumes

Rocketship Antioch

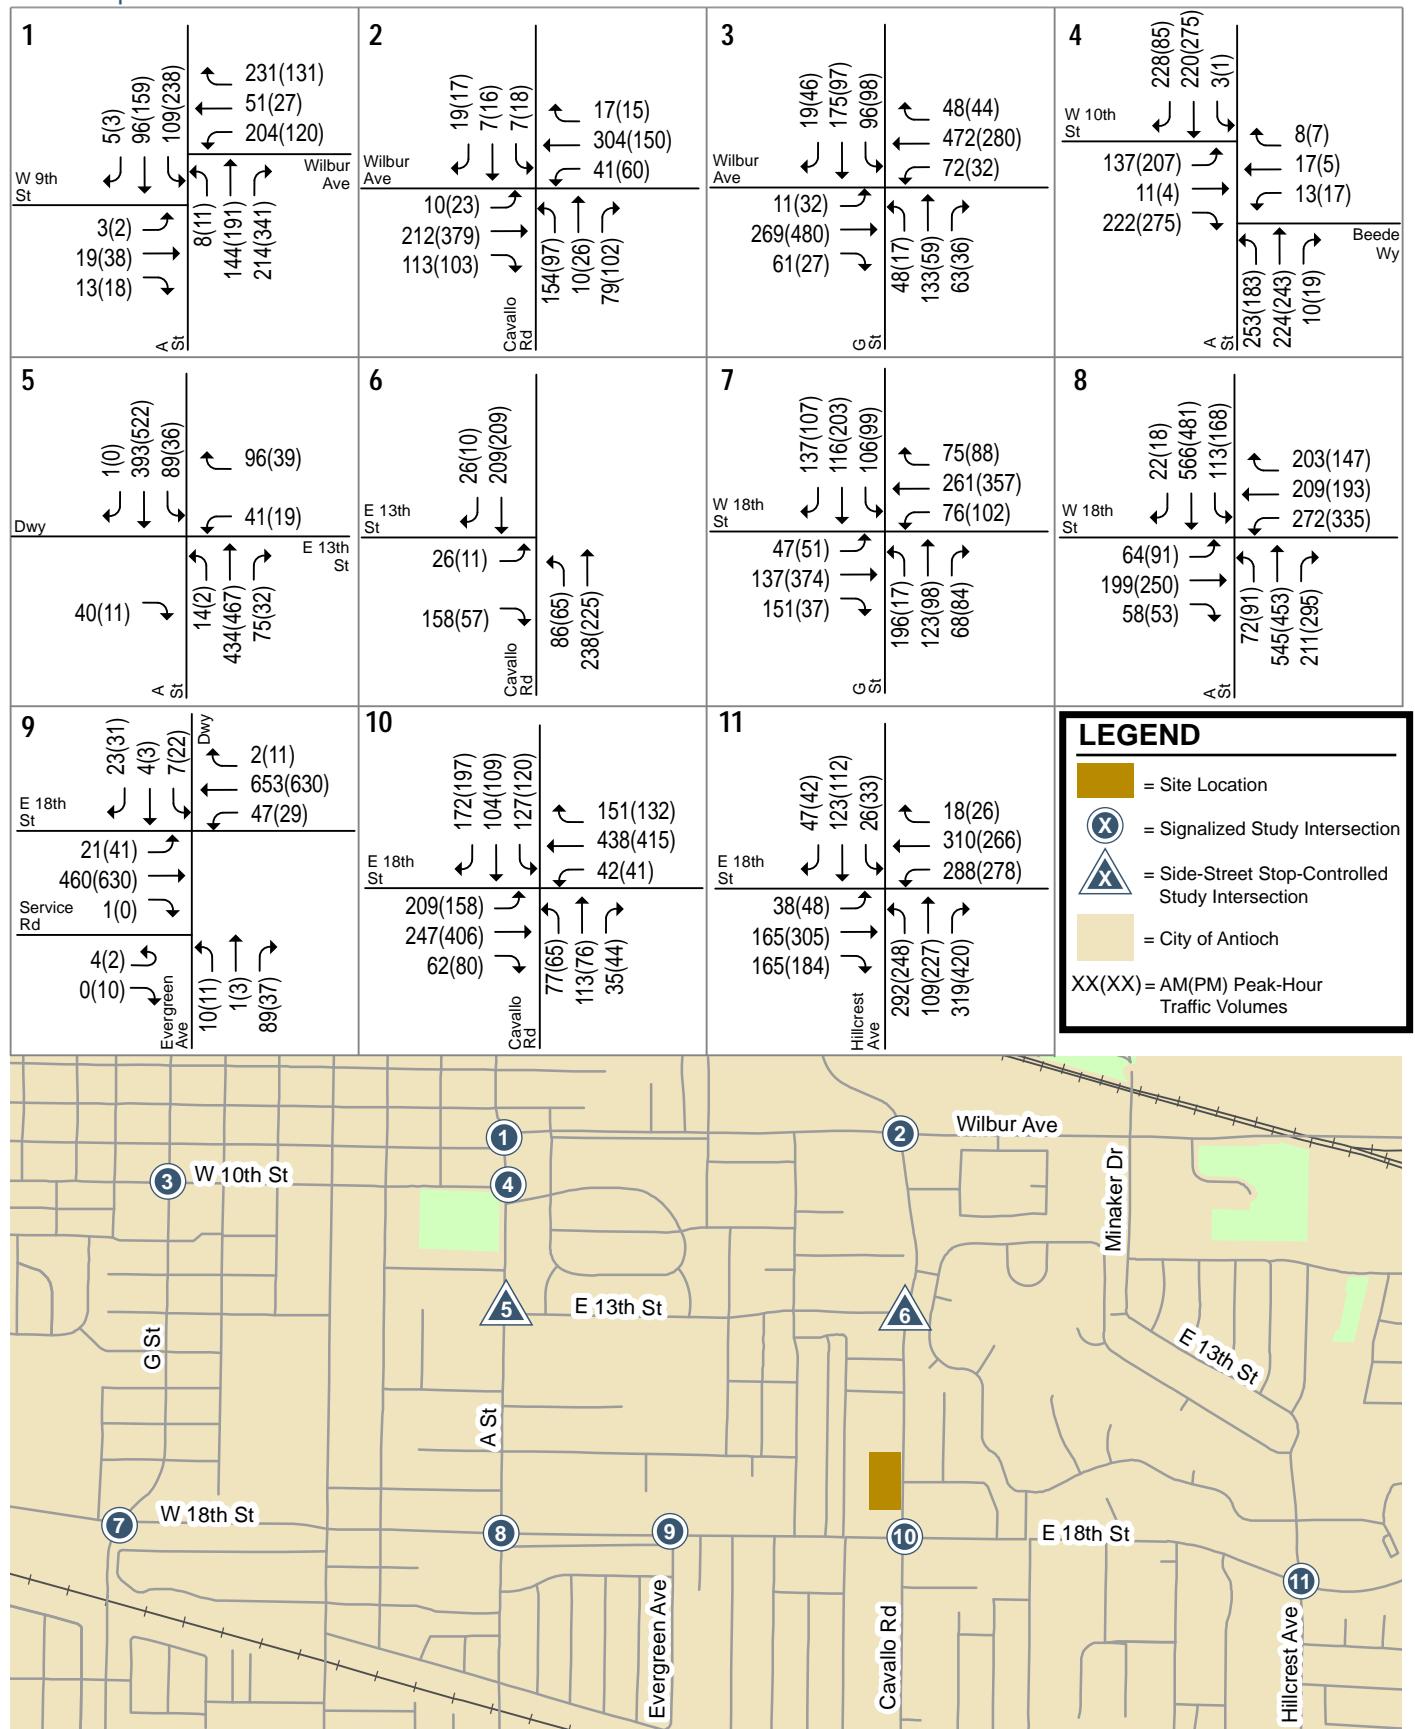

Figure 11
Cumulative Plus Project Traffic Volumes

Intersection Levels of Service Analysis

The results of the level of service analysis under cumulative conditions are summarized in Table 8. The results show that, when measured against the City of Antioch and ECAP level of service standards, all of the signalized study intersections are expected to operate at an acceptable level (high-level LOS D or better) both with and without the proposed project. The intersection level of service calculation sheets are included in Appendix C.

The worst stop-controlled approaches at both unsignalized study intersections would operate at LOS C or better under cumulative plus project conditions during one or both peak hours, which complies with the City's mid-level LOS D standard for intersections not on a route of regional significance.

Bold indicates a substandard level of service.

Bold indicates a significant project impact.

5. Other Transportation Issues

This chapter presents other transportation issues associated with the project. These transportation issues include an analysis of:

- Site access and circulation
- Vehicle queuing
- Potential impacts to transit, bicycle, and pedestrian facilities

Unlike the level of service impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgement in accordance with the standards and methods employed by the traffic engineering community.

Site Access and On-Site Circulation

This section describes the site access, circulation, and parking for the proposed project. Site access and on-site circulation were evaluated using commonly accepted traffic engineering principles. This review is based on the project site plan labeled “Rocketship Antioch Site Plan” provided by Swift Lee Office on January 17, 2017 (See Figure 2).

Project Driveway Operations

Site access was evaluated to determine the adequacy of the site’s driveways with regard to the following: traffic volume, delays, vehicle queues, geometric design, and corner sight distance. Vehicular access to the project site would be provided via one full-access driveway and two one-way driveways on Cavallo Road. In addition, the project will have access via the adjacent county parcel. During the peak drop-off and pick-up periods before and after school, parents will enter the northern driveway on the adjacent county parcel and circulate along the western edge of the property before exiting from the one-way, exit-only driveway at the southeastern edge of the project site.

The full-access driveway would be located along the northeastern edge of the project site, and provide access to the northern parking lot. The full-access driveway would have a width of 26 feet. The one-way driveways would be located along the southeastern edge of the project site and provide access to the southern parking lot and egress for vehicles exiting the student loading zone along the western edge of the site. While the entry-only driveway would allow both right and left turns into the site, the exit-only driveway would be restricted to right turns only. Because the traffic volumes on Cavallo Road are moderate and the exit driveway will be restricted to right turns only, delay and queues for exiting vehicles are expected to be minimal. An analysis of the inbound left-turn queue length is provided below. The entry-only and exit-only driveway would have a width of 20 feet and 17 feet, respectively. The City of Antioch requires a minimum of 15 feet for a one-way driveway, and 26 feet for a two-way driveway. Therefore, the project would meet the City’s design standards for driveway widths.

Adequate sight distance should be provided at the project driveways. Adjacent to the project site, there are no roadway curves, on-street parking, or landscaping features that obstruct the vision of exiting drivers. The site plans do not show any landscaping features that would interfere with the sight distance at any of the site driveways. In order to ensure the safety of the students, no objects should be placed within the sight distance triangle that would obstruct the vision of exiting drivers.

On-Site Circulation

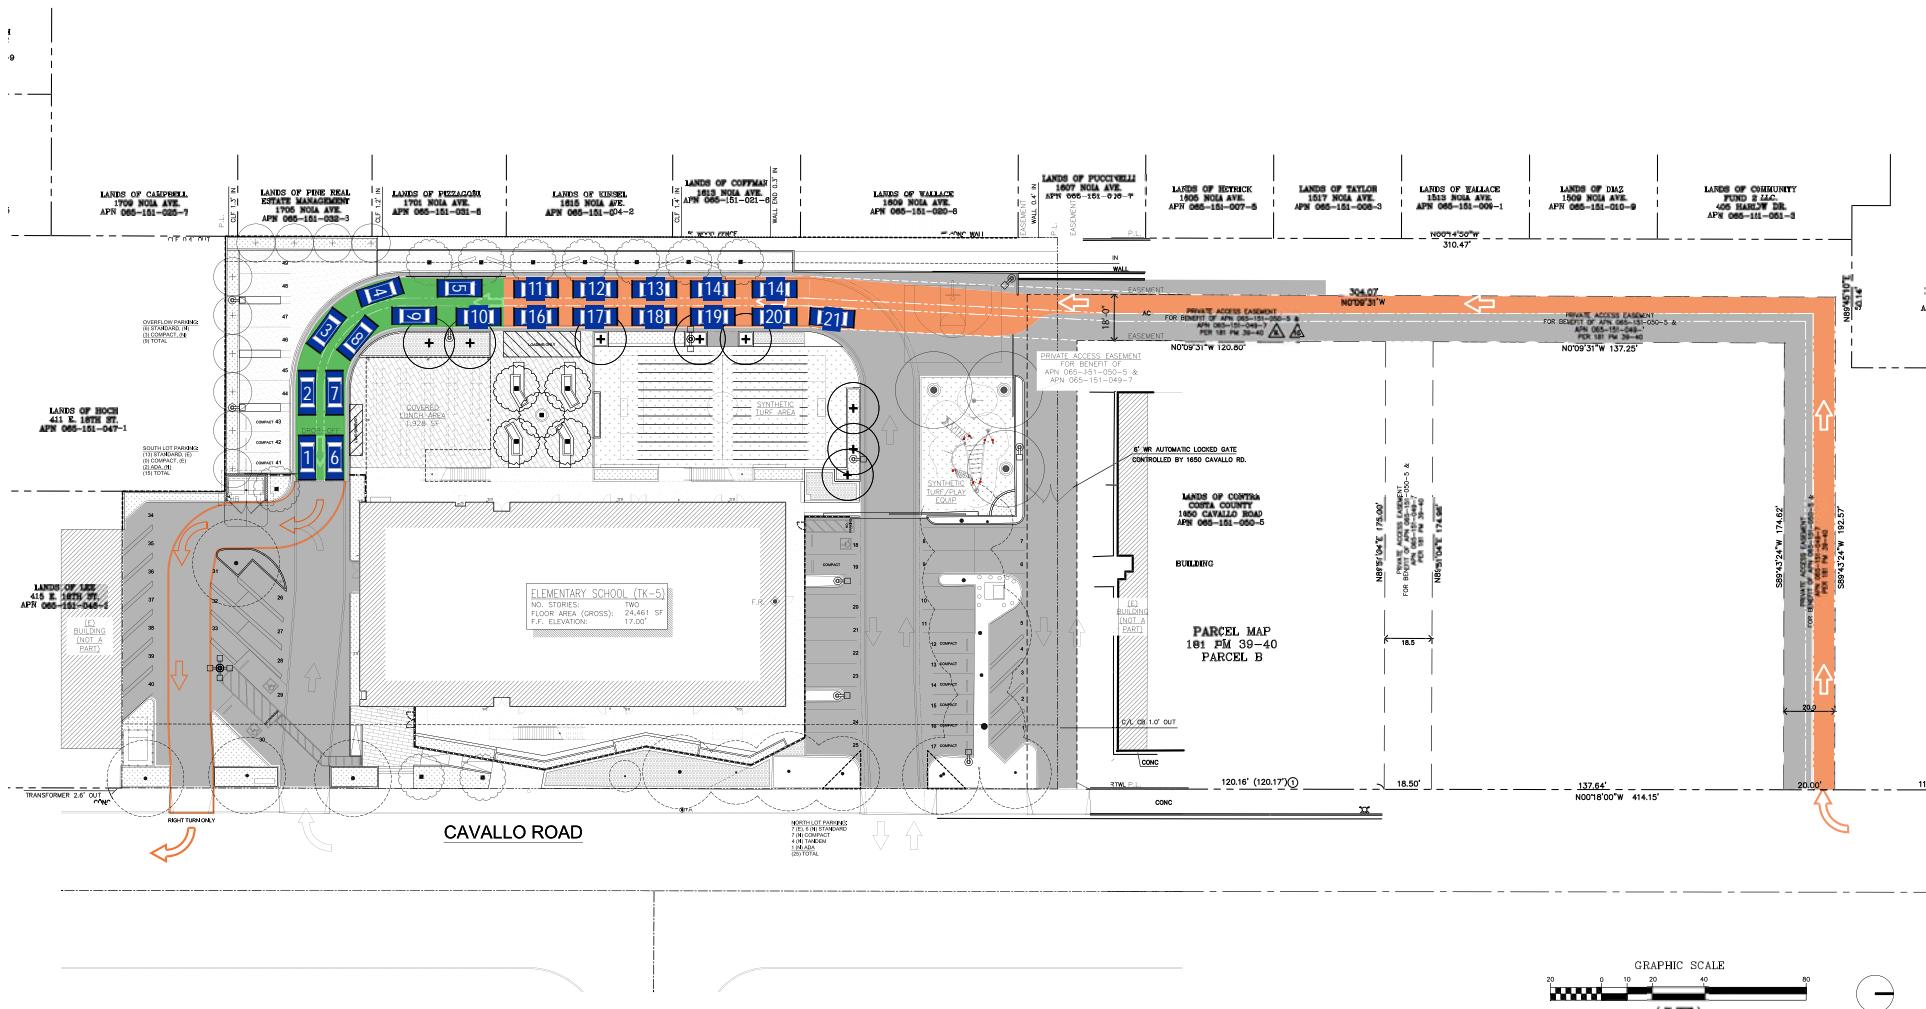

The on-site circulation was reviewed in accordance with the City of Antioch Zoning Code and generally accepted traffic engineering standards. Generally, the proposed plan would provide vehicle traffic with adequate connectivity through the parking areas. During school hours, when the gates to the outdoor play area west of the school building will be closed, the northern parking lot would have a single two-way dead-end drive aisle with 90-degree perpendicular parking spaces. The drive aisle width (26 feet) provides sufficient space for vehicles to back out of the parking stalls. Because there is not sufficient space at the end of the aisle for vehicles to turn around if the lot is full, it is recommended that these parking spaces be reserved for staff parking only. There is four feet between the last parking space at the end of the aisle and the gate, which will facilitate vehicle maneuvers in and out of these parking spaces. The northern parking lot also includes 45-degree angled parking spaces adjacent to a 20-foot drive aisle that would be accessed via the easement through the adjacent county parcel. The site plan also shows four 90-degree tandem spaces within the northern parking lot. It is recommended that these tandem spaces be converted to standard 90-degree spaces with two spaces accessed via the adjacent county parcel and two spaces accessed via the two-way project driveway.

Vehicles traveling within the southern parking area would circulate in a counterclockwise manner from the entrance-only driveway at the northern edge of the lot to the exit-only driveway at the southern edge of the lot. The southern parking lot would provide 45-degree parking adjacent to one-way drive aisles that range from 18 to 25 feet wide. The proposed aisle width meets the City's standards.

The project site also would provide 90-degree parking spaces near the southwest corner of the site adjacent to the student loading zone. Gates will block access to these spaces during the school day, thus they will be used only for overflow parking during events outside regular school hours.

Student Drop-off and Pick-up

Student unloading/loading and queue storage of vehicles waiting to drop-off/pick-up students will occur in the one-way drive aisle along the western edge of the project site. During the peak periods before and after school, parents will access the student loading/unloading zone via the northern driveway on the adjacent county property. Parents will then proceed in a single lane west and then south through the County parking lot before entering the project site via a gate near the basketball court at the northwest corner of the project site. Within the project site, vehicles will be permitted to proceed in either of two lanes along the western edge of the site (See Figure 12). The student loading zone would begin adjacent to the covered lunch area and extend approximately 125 feet in length to the southern exit gate adjacent to the trash enclosure. The student loading zone would allow up to five vehicles in each lane to load simultaneously. School staff or volunteers should direct traffic and place cones in the drive aisles while students unload/load. After all students have cleared the loading zone, staff should remove the cones and allow traffic to move again so that the next 10 vehicles can enter the loading zone. Staff members or parent volunteers should be stationed along the length of the student loading zone to assist students in and out of vehicles and ensure they safely walk to the school. Staff or volunteers should also ensure that parents do not leave their vehicles unattended in the loading zone while they visit the school and direct parents to unload/load students in a timely manner and then exit the loading zone. Parents that need additional time, for example to complete a phone call or to communicate with students before leaving the site should be directed to park in the designated on-site parking spaces to ensure the loading zone is available for its intended purpose.

LEGEND

- = Student Loading Zone (125 feet per lane)
- = Estimated Maximum Queue Length (275 feet per lane including vehicles in loading zone)
- = Total Available Queue Storage (1095 feet including loading zone)

Figure 12
Project Student Drop-Off/Pick-up Circulation

Furthermore, during the peak student unloading/loading periods, the entry-only driveway at the southern on-site parking lot should be monitored by staff or volunteers to prevent parents from using the parking area as a student unloading/loading zone and to avoid conflicts with vehicles exiting the designated student loading/unloading zone. Staff and/or traffic cones should be positioned adjacent to the exit gate at the end of the student loading/unloading zone to instruct vehicles to merge into one lane and direct traffic flow toward the exit-only driveway. There is approximately 175 feet of space for vehicles to queue in the southern parking lot after exiting the loading zone while waiting to turn out onto Cavallo Road. The queue storage space for outbound vehicle would be sufficient to prevent queues from backing up into the student loading/unloading zone.

School drop-off and pick-up operations and resulting queues were observed at Rocketship Mateo Sheedy Elementary and Rocketship Si Se Puede Academy in San Jose. The length of vehicle queues at the project site was estimated based on our observations at these existing Rocketship schools. The estimates take into account the projected enrollment (600 students) and the length of the student loading zone (125 feet in each of two lanes). It is estimated that 525 feet of queuing space would be needed for drop-off operations and 450 feet of queue storage would be needed for pick-up operations. Longer queues were observed during the morning drop-off period than the afternoon pick-up period because all grades start at the same time in the morning, whereas dismissal times in the afternoon vary by grade level and some students remain on site to participate in after school programs. Including the storage space within and upstream of the student loading/unloading zone and excluding the vehicle stacking space downstream of the loading zone, the site plan shows that on-site queue storage usable for drop-off and pick-up operations would total 650 feet. Thus, drop-off and pick-up queues during the peak periods before and after school are expected to be contained within the project site and not extend onto the County parcel. Nevertheless, approximately 450 of additional queue storage space is available within the easement on the adjacent County property. Thus, queues associated with Rocketship School would not extend on to Cavallo Road.

The drive aisles on the County site range from approximately 30 feet at the northern driveway to 21 feet behind the County building. Given the drive aisle width on the County property and that vehicle queues are not expected to extend beyond the project site, use of the access easement is not expected to substantially affect on-site circulation within the County property.

Queuing Analysis

The operations analysis is based on vehicle queuing for high-demand movements at intersections. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

P (x=n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25

feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement.

The following ten left-turn movements were examined as part of the queuing analysis for this project:

- Southbound and westbound left turn at “A” Street and West 9th Street/Wilbur Avenue
- Northbound left turn at Cavallo Road and Wilbur Avenue
- Northbound left turn at “A” Street and West 10th Street/Beede Way
- Northbound left turn at Cavallo Road and East 13th Street
- Westbound left-turn/through movement at “A” Street and East 18th Street
- Eastbound and southbound left turn at Cavallo Road and East 18th Street
- Northbound left-turn/through movement at Hillcrest Avenue and East 18th Street
- Northbound left turn at Cavallo Road and County Driveway

At the intersection of “A” Street and East 18th Street, the westbound left-turn movement consists of one left-turn lane and one shared left-turn/through lane. Given that the left-turn and through movements are combined in a shared lane, the queue analysis on this approach reflects both the left-turn and through movements. Similarly, the queuing analysis on the northbound Hillcrest Avenue approach to East 18th Street reflects both the left-turn and through movements as they share a travel lane. The estimated queue lengths based on the Poisson numerical calculations show queuing deficiencies at two locations (see Table 9).

“A” Street and West 10th Street/Beede Way

At the “A” Street and West 10th Street/Beede Way intersection, the 95th percentile queue for the northbound left turn currently exceeds the existing turn pocket storage capacity by 60 feet, or two vehicles during the AM peak hour, and by 10 feet (less than one vehicle) during the PM peak hour. Field observations, however, did not show any instances where this queue exceeded the available storage. Under cumulative conditions, the 95th percentile queue is expected to continue to exceed the storage capacity by 60 feet and 10 feet during the AM and PM peak hours, respectively. With the additional trips added by the Rocketship School project, the 95th percentile queue would increase by one vehicle during both peak hours. The small increase in queue length would have a negligible effect on traffic operations at this intersection because the left-turn spillback would be expected to last for only a few seconds during only one signal cycle in the AM and PM peak hours. Therefore, no improvements are recommended.

Cavallo Road and East 18th Street

The eastbound left-turn pocket at the Cavallo Road and East 18th Street intersection currently provides sufficient storage for the existing queues during both the AM and PM peak hours. With the additional trips added by the Rocketship School project, the 95th percentile queue will increase by 75 feet and 50 feet, or three vehicles and two vehicles, during the AM and PM peak hours, respectively. The increase in queue length would exceed the existing turn pocket storage, possibly causing some left-turn vehicles to queue in the adjacent through lane while waiting to enter the left-turn pocket. Because East 18th Street has two through lanes in each direction, through traffic could continue to proceed in the curb lane if the inner through lane is blocked by left-turn traffic. The queue spillover would have an insignificant effect on traffic operations at this intersection because the spillover would occur for only a few seconds during only some signal cycles during the peak hours before and after school, and the left-turn queue is expected to completely dissipate during each signal cycle. Furthermore, the intersection would continue to operate at LOS C even if eastbound through traffic were reduced to the use of a single lane for the entire hour. Nevertheless, median striping modifications are recommended to encourage eastbound left-turn queues to extend into the center turn lane if necessary (see Figure 13). The

modification would remove the left-turn pocket taper striping to increase the queue storage available for use by eastbound left-turn traffic while still accommodating the existing left turns to and from adjacent driveways and Woodland Drive.

Hillcrest Avenue and East 18th Street

At the Hillcrest Avenue and East 18th Street intersection, the 95th percentile queue for the northbound left-turn/through movements is expected to exceed the existing turn pocket storage capacity by 90 feet during the PM peak hour under cumulative conditions. The additional trips added by the Rocketship School project are not expected to increase the 95th percentile queue. Therefore, the project is not required to implement improvements at this intersection.

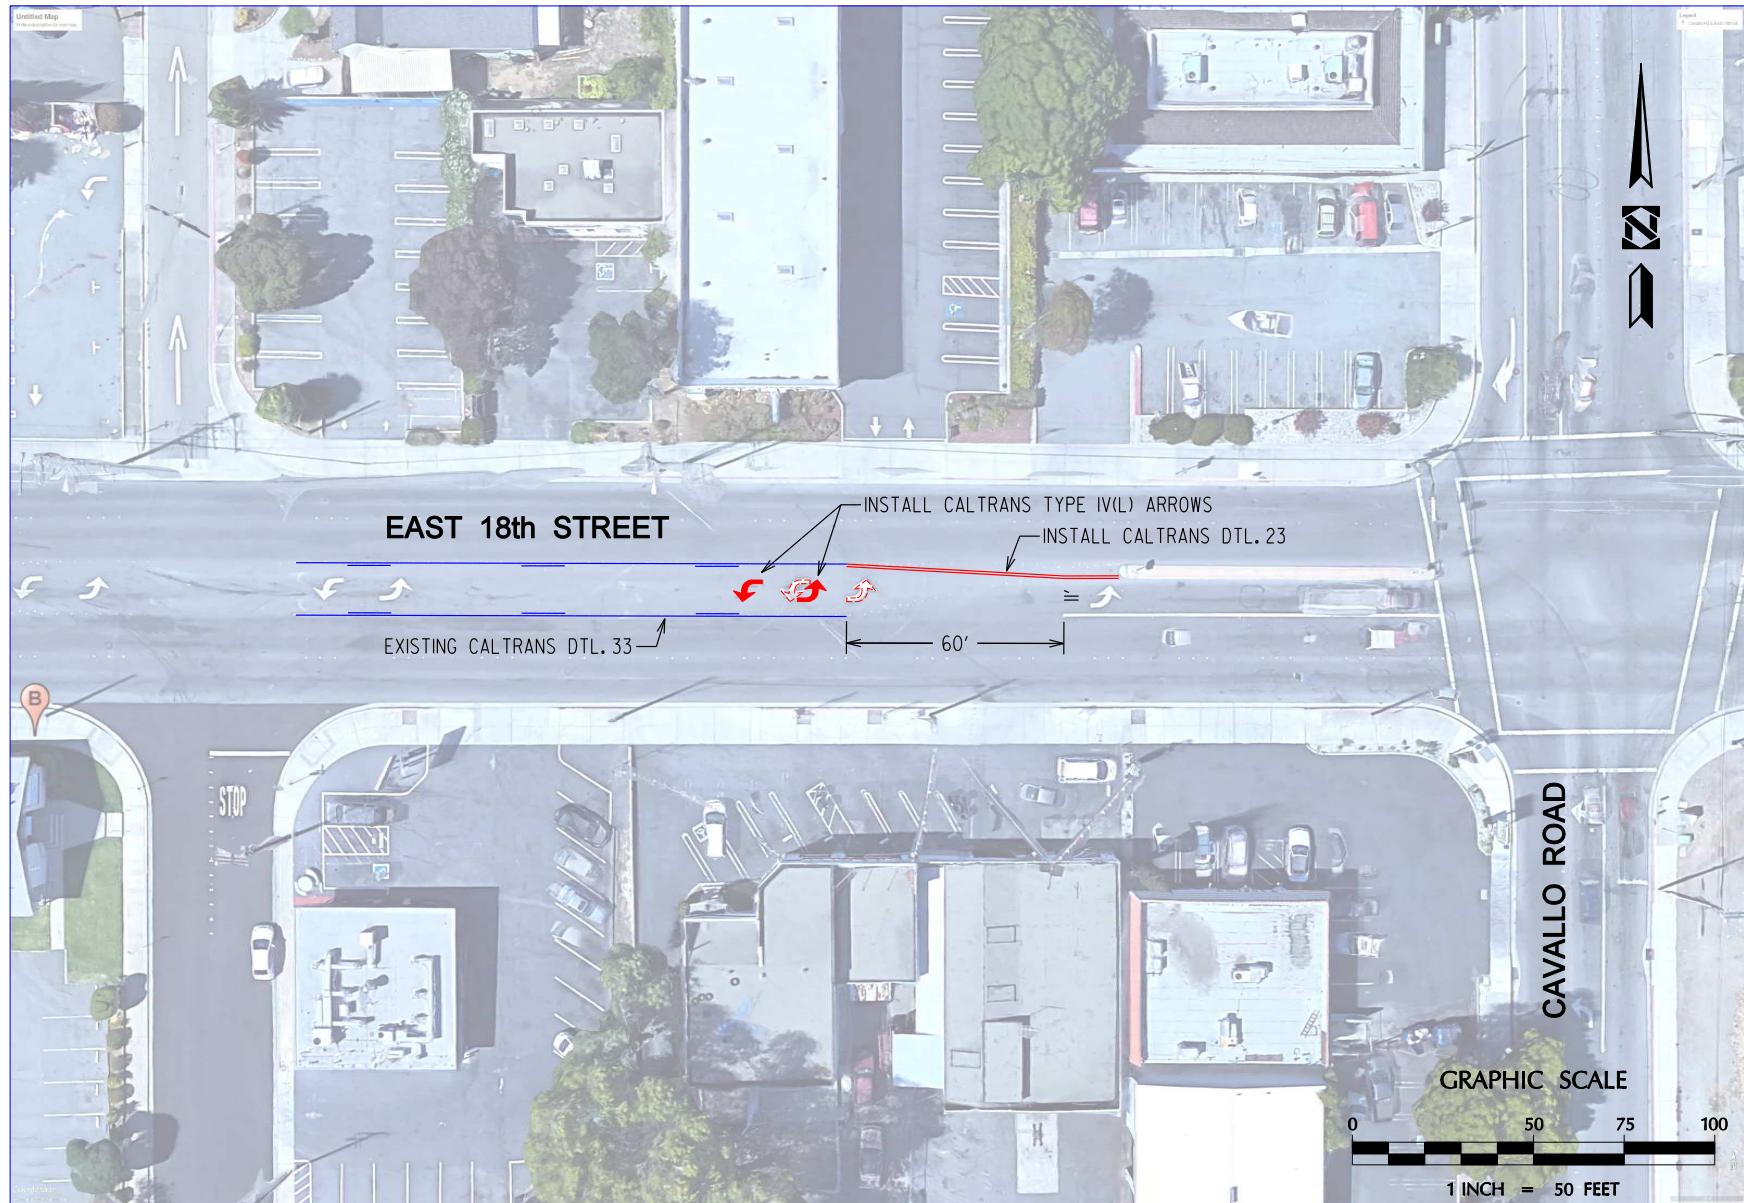

Figure 13
Recommended Median Restriping on East 18th Street at Cavallo Road

The existing turn storage is expected to be sufficient to accommodate the 95th percentile queue length for all other locations including the left-turn movement from northbound Cavallo Road into the adjacent County property, which would be used by parents dropping off and picking up students during the peak hours before and after school.

Transit, Pedestrian, and Bicycle Analysis

Transit in the study area is provided by Tri Delta Transit. The study area is served directly by eight local bus routes, three of which provide service within a ½ mile of the project site: Local Route 380, Local Route 387, and Local Route 388. Combined, these routes provide service between the Pittsburg/Bay Point BART Station, Deer Valley Kaiser Medical Center, and the Tri Delta Transit Station (see Chapter 2 for detailed discussion). The 2015 U.S. Census reports that bus trips comprise approximately 7.5% of the total commute mode share in the City of Antioch. Assuming the same mode split for the proposed project, this would equate to 43 transit trips during the AM and 24 transit trips during the PM peak commute hours. According to the Tri Delta Short Range Transit Plan, the capacity of their bus fleet ranges between 44 and 56 seats per vehicle. With one or two bus trips in each direction on every route during commute hours, and given that the estimated transit volume of riders would be dispersed among the different routes, the project-generated riders would not exceed the carrying capacity of the existing bus service near the project site.

Pedestrian facilities in the study area consist of sidewalks located on both sides of Cavallo Road and other nearby neighborhood roadways (e.g., East 13th Street, Noia Avenue, East 14th Street) in the vicinity of the project. Pedestrian travel to and from the project site is also aided by marked crosswalks with pedestrian signal heads and push buttons at all but one approach at the signalized study intersections, and marked crosswalks along all stop-controlled approaches at unsignalized study intersections. Although one crosswalk connection is missing, the overall network of sidewalks and crosswalks in the study area has good connectivity and provides pedestrians with safe routes to the proposed school, nearby transit stops, and other points of interest in the vicinity of the project site.

Bicycle lanes are present on portions of Wilbur Avenue, on Cavallo Road, Hillcrest Avenue, and Lake Drive. Although none of the adjacent residential streets have striped bike lanes, the low traffic volumes make these roadways conducive to bicycle traffic. In addition, bikes and pedestrians could also use the Delta de Anza Regional Trail, which connects to Hillcrest Avenue. The sidewalks and bikeways in the school vicinity are adequate to serve students who may walk or bike to school.

6. Conclusions

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Antioch, Contra Costa Transportation Authority (CCTA) Congestion Management Program (CMP), and the East County Action Plan (ECAP). The traffic study includes an analysis of AM and PM peak hour traffic conditions for nine signalized intersections and two unsignalized intersection in the vicinity of the project site. The analysis focuses on the peak commute periods between 7:00 and 9:00 AM and between 4:00 and 6:00 PM, because it is during these hours that traffic conditions on the surrounding roadways are generally the most congested.

Intersection Level of Service Analysis

The analysis determined that under all scenarios with and without the project, when measured against the City of Antioch and ECAP level of service standards, all of the study intersections are expected to operate at acceptable levels (high-level LOS D or better). In addition, under all scenarios with and without the project, the worst stop-controlled approaches at the unsignalized study intersections would operate at LOS C or better during one or both peak hours, which complies with the City's mid-level LOS D standard for intersections not on a route of regional significance. Therefore, the project would not result in a significant impact on intersection levels of service.

Other Transportation Issues

According to the 2013 Contra Costa County CMP *Technical Procedures*, the proposed project would not have an adverse effect on the existing transit, pedestrian, or bicycle facilities in the study area.

Based on a review of the project site plan, Hexagon has provided the following recommendations to improve site access, and on-site circulation.

Recommendations

- The northern parking lot should be reserved for staff parking only, given that there is not sufficient space at the end of the aisle for vehicles to turn around if the lot is full.
- The four 90-degree tandem spaces within the northern parking lot should be converted to standard 90-degree spaces with two spaces accessed via the adjacent county parcel and two spaces accessed via the project driveway.
- During student unloading/loading periods, school staff or volunteers should direct traffic and place cones in the drive aisles while students unload/load. After all students have cleared the loading zone, staff should remove the cones and allow traffic to move again so that the next 10

vehicles can enter the loading zone. Staff members or parent volunteers should be stationed along the length of the student loading zone to assist students in and out of vehicles and ensure they safely walk to the school. Staff or volunteers should also ensure that parents do not leave their vehicles unattended in the loading zone while they visit the school and direct parents to unload/load students in a timely manner and then exit the loading zone. Parents that need additional time, for example to complete a phone call or to communicate with students before leaving the site should be directed to park in the designated on-site parking spaces to ensure the loading zone is available for its intended purpose.

- During the student unloading/loading periods, the entry-only driveway at the southern on-site parking lot should be monitored by staff or volunteers to prevent parents from using the parking area as a student unloading/loading zone and to avoid conflicts with vehicles exiting the designated student loading/unloading zone. Staff and/or traffic cones should be positioned adjacent to the exit gate at the end of the student loading/unloading zone to instruct vehicles to merge into one lane and direct traffic flow toward the exit-only driveway.
- At the Cavallo Road/East 18th Street intersection, the additional trips added by the proposed Rocketship School would increase the eastbound 95th percentile left-turn queue by 75 feet and 50 feet, or three vehicles and two vehicles, during the AM and PM peak hours, respectively. The increase in queue length would exceed the existing turn pocket storage, possibly causing some left-turn vehicles to queue in the adjacent through lane while waiting to enter the left-turn pocket. Because East 18th Street has two through lanes in each direction, through traffic could continue to proceed in the curb lane if the inner through lane is blocked by left-turn traffic. The queue spillover would have an insignificant effect on traffic operations at this intersection because the spillover would occur for only a few seconds during only some signal cycles during the peak hours before and after school, and the left-turn queue is expected to completely dissipate during each signal cycle. Furthermore, the intersection would continue to operate at LOS C even if eastbound through traffic were reduced to the use of a single lane for the entire hour. Nevertheless, median striping modifications are recommended to encourage eastbound left-turn queues to extend into the center turn lane if necessary. The modification would remove the left-turn pocket taper striping to increase the queue storage available for use by eastbound left-turn traffic while still accommodating the existing left turns to and from adjacent driveways and Woodland Drive.

Re: Response to Peer-Review Comments on the Traffic Study Prepared for the Proposed Rocketship School at 1700 Cavallo Road in Antioch, California

Dear Mr. Bowman,

This letter provides our responses to the peer-review comments provided by Kimley-Horn and Associates, Inc. (Kimley-Horn), dated July 31, 2017 on the draft traffic study prepared for the proposed new elementary school at 1700 Cavallo Road in Antioch, California.

1. **Comment:** In review of the Synchro outputs in the Appendix, it appears that a factor of 0.92 was not used for all intersections. The following is a list of PHF by intersection:

- Int #1 – PHF = 0.90 in the AM peak hour and 0.92 in the PM peak hour
- Int #2 – PHF = 0.90 in the AM peak hour and 0.90 in the PM peak hour
- Int #3 – PHF = 0.95 in the AM peak hour and 0.92 in the PM peak hour
- Int #4 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #5 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #6 – PHF = 0.90 in the AM peak hour and 0.90 in the PM peak hour
- Int #7 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #8 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #9 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #10 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour
- Int #11 – PHF = 0.92 in the AM peak hour and 0.92 in the PM peak hour

Please confirm.

Response: The peak hour factors listed in this comment are correct. A factor of 0.92 or 0.90 was applied at each intersection in accordance with the CCTA Technical Procedures depending on the volumes. For the "G" Street intersections (10th Street and 18th Street), where the traffic volumes were obtained from the Antioch High School Traffic Study, that study's respective peak hour factors were used to maintain consistency.

2. **Comment:** Figure 5 shows one EB through lane and one shared through-right turn lane. It is missing the EB left turn lane. Please update.

Response: The existing lane configuration figure (Figure 5) has been modified to reflect the inclusion of an eastbound left-turn lane.

3. **Comment:** The text, on page 34, describing the queues for the intersection of "A" Street and West 10 Street/Beede Way was not updated to reflect the updated storage length of

Mr. Gant Bowman
August 1, 2017
Page 2 of 2

190 feet. It still mentions that the queue exceeds the storage by 25 feet, but with the updated 190 feet storage, the queue exceeds the storage by 60 feet in the Existing and Cumulative AM scenarios and by 10 feet in the Existing and Cumulative PM scenarios. Please update.

Response: The updated report includes a revised queuing analysis description for the "A" Street and West 10th Street/Beede Way intersection that says the project would increase the 95th percentile peak hour queues by one vehicle; however, the small increase in queue length would have a negligible effect on traffic operations at this intersection, thus no improvements are recommended.

Please do not hesitate to contact us if there are any further questions regarding the Rocketship Traffic Study.

Sincerely,
HEXAGON TRANSPORTATION CONSULTANTS, INC.
